Infinitely many precomplete with respect to parametric expressibility classes of formulas in a provability logic of propositions

Andrei Rusu

Abstract

In the present paper we consider a non-tabular extension \( L \) of the well-known propositional provability logic \( GL \) together with the notion of parametric expressibility of formulas in a logic proposed by A. V. Kuznetsov. We prove that there are infinitely many precomplete with respect to parametric expressibility classes of formulas in the above mentioned logic \( L \).

1 Introduction

We consider an extension \( L \) of the propositional provability logic of Gödel-Löb [1]. In 1921 E. Post analysed the possibility to get a formula from other formulas by means of superpositions [2, 3] and proved that there is a numerable collection of closed with respect to superpositions classes of boolean functions, among which only 5 of them are maximal with respect to inclusion. A. V. Kuznetsov have generalized the notion of superposition of functions to the case of formulas and put into consideration the notion of parametric expressibility of a formula via a system of formulas in a given logic [4, 5, 6] and proved there are finitely many precomplete with respect to parametric expressibility classes of formulas in the above mentioned logics.

Key Words: parametric expressibility of formulas, modal logic, diagonalizable algebra, precomplete classes of formulas with respect to parametric expressibility, extensions of logics.

expressibility classes of formulas in the general 2-valued and 3-valued logics. Later on it was proved in [7] there are finitely many closed with respect to parametric expressibility classes of formulas in the general \( k \)-valued logic (these classes are referred in [7] to as primitive positive clones). In the present paper we consider formulas of an extension \( L \) of the propositional provability logic \( GL \) and prove there are infinitely many precomplete with respect to parametric expressibility classes of formulas in \( L \). The proof uses the fact that the above mentioned logic \( L \) coincides with a logic of a Magari’s algebra defined further.

2 Definitions and notations

Propositional provability logic \( GL \) [1]. The calculus \( G \) of the propositional provability logic \( GL \) is based on formulas built as usual from propositional variables \( p, q, r, p_1, q_i, r_j \ldots \), logical connectives \&.\lor.\supset.\neg.\Delta \) and auxiliary symbols of left and right parantheses ( and ). Let Form denote the set of all formulas of the calculus \( G \). The variables occurring in the formula \( F \) we denote by \( \text{Var}(F) \). Axioms of \( GL \) are the axioms of the classical logic of propositions together with the following three formulas:

\[
\Delta(p \supset q) \supset (\Delta p \supset \Delta q), \\
\Delta p \supset \Delta \Delta p, \\
\Delta(\Delta p \supset p) \supset \Delta p.
\]  

The rules of inference are the well-known rules of modus ponens and substitution supplemented with the rule of necessitation:

\[
\frac{A}{\Delta A}
\]  

The notion of theorem (deductible formula) in the calculus \( G \) is defined as usual based on axioms and inference rules of \( G \). Denote all theorems of \( G \) by \( \text{Th} \). Then, the propositional provability logic \( GL \) of \( G \) is considered the pair \( (\text{Form}, \text{Th}) \). Since set \( \text{Form} \) is known traditionally by logic \( GL \) is understood the set \( \text{Th} \). Any set of formulas \( L \) containing \( GL \) and closed with respect to rules of inference of \( G \) is said to be an extension of \( GL \).

Denote by \( p \sim q \) and \( \Delta^2 p, \ldots, \Delta^{n+1} p, \ldots \) (\( n = 1, 2, \ldots \)) the corresponding formulas \( (\neg p \lor q) \& (\neg q \lor p) \) and \( \Delta(\Delta p), \ldots, \Delta(\Delta^n p), \ldots \). Denote by \( \square p \) the formula \( p \& \Delta p \) and let \( \nabla p \) means formula \( \square \neg \square \neg \square p \).

Parametric expressibility of formulas [4]. Suppose in the logic \( L \) we can define the equivalence of two formulas. The formula \( F \) is said to be (explicitly) expressible via a system of formulas \( \Sigma \) in the logic \( L \) if \( F \) can be obtained from any variables and formulas of \( \Sigma \) using two rules:
1. the rule of weak substitution, which allows to pass from two formulas, let say $A$ and $B$, to the result of substitution of one of them, $B$, in another one, $A$, in place of every occurrence of any fixed variable $p$ (the result of substitution we denote as $A[p/B]$, or $A[B]$)

\[
\frac{A, B}{A[p/B]}
\]  

(3)

2. if we already get formula $A$ and we know $A$ is equivalent in $L$ to formula $B$, then we can consider we also have formula $B$

\[
\frac{A, A \sim B}{B}
\]

(4)

The formula $F$ is said to be parametrically expressible via the system of formulas $\Sigma$ in the logic $L$ if there exist variables $q_1, \ldots, q_s, q$ not occurring in $F$, formulas $D_1, \ldots, D_s$, formulas $B_1, \ldots, B_m$ and $C_1, \ldots, C_m$ such that $B_1, \ldots, B_m$ and $C_1, \ldots, C_m$ are explicitly expressible in $L$ via $\Sigma$ and the following first-order formulas are valid:

\[
(F = q) \Rightarrow (\bigwedge_{i=1}^{m} (B_i = C_i))[q_1/D_1] \ldots [q_s/D_s],
\]

(5)

\[
(\bigwedge_{i=1}^{m} (B_i = C_i)) \Rightarrow (F = q).
\]

(6)

The system of formulas $\Sigma$ is said to be complete with respect to parametric expressibility in the logic $L$ if any formula of the calculus of $L$ is parametrically expressible via formulas of $\Sigma$. The system $\Sigma$ is called precomplete with respect to parametrical expressibility in the logic $L$ if it is not complete in $L$, but for any formula $F$, which is not parametrically expressible via formulas $\Sigma$, the system $\Sigma \cup \{F\}$ is already parametrically complete in $L$.

**Magari’s algebras.** A Magari’s algebra \cite{8} $\mathfrak{D}$ is a boolean algebra $\mathfrak{A} = (A; \&, \lor, \supset, \neg, 0, 1)$ with an additional operator $\Delta$ satisfying the following relations:

\[
\begin{align*}
\Delta(x \supset y) &\leq \Delta x \supset \Delta y, \\
\Delta x &\leq \Delta \Delta x, \\
\Delta(\Delta x \supset x) &\equiv \Delta x, \\
\Delta 1 &\equiv 1,
\end{align*}
\]

where $1$ is the unit of $\mathfrak{A}$.

We consider the Magari’s algebra $\mathfrak{M} = (M; \&, \lor, \supset, \neg, \Delta)$ of all infinite binary sequences of the type $\alpha = (\mu_1, \mu_2, \ldots), \mu_i \in \{0, 1\}, i = 1, 2, \ldots$. The
boolean operations $\&, \lor, \supset, \neg$ over elements of $M$ are defined component-wise, and the operation $\Delta$ over element $\alpha$ we define by the equality $\Delta \alpha = (1, \nu_1, \nu_2, \ldots)$, where $\nu_i = \mu_1 \& \cdots \& \mu_i$. Consider the subalgebra $\mathcal{M}^*$ of $\mathcal{M}$ generated by its zero $0$ element $(0, 0, \ldots)$. Remark the unite $1$ of the algebra $\mathcal{M}^*$ is the element $(1, 1, \ldots)$.

Interpreting logical connectives of a formula $F$ by corresponding operations on a Magari’s algebra $\mathcal{D}$ we can evaluate $F$ on any algebra $\mathcal{D}$. If for any evaluation of variable of $F$ by elements of $\mathcal{D}$ the resulting value of the formula $F$ on $\mathcal{D}$ is $1$ they say $F$ is valid on $\mathcal{D}$. The set of all valid formulas on a given Magari’s algebra $\mathcal{D}$ is known to form an extension of the logic $GL$ [9].

They say formula $F(p_1, \ldots, p_n)$ conserves on the Magari’s algebra $\mathcal{D}$ the relation $R(x_1, \ldots, x_m)$ if for any elements $\alpha_{11}, \ldots, \alpha_{mn}$ of $\mathcal{D}$ the relations

\[ R(\alpha_{11}, \ldots, \alpha_{m1}), \ldots, R(\alpha_{1n}, \ldots, \alpha_{mn}) \]

implies

\[ R(F(\alpha_{11}, \ldots, \alpha_{1n}), \ldots, F(\alpha_{m1}, \ldots, \alpha_{mn})) \]

Let $\alpha \in \mathcal{D}$. Obviously, formula $F(p_1, \ldots, p_n)$ conserves the relation $x = \alpha$ on $\mathcal{D}$ if $F(\alpha, \ldots, \alpha) = \alpha$. According to A. F. Danil’čenko [6], the set of all formulas conserving the relation $x = \alpha$ on an arbitrary $k$-element set is closed with respect to parametrical expressibility.

3 Preliminary results

We start by validating some useful properties of the formulas $\Box p, \Delta p$ and $\nabla p$.

**Proposition 1.** Let $x, y$ arbitrary elements of $\mathcal{M}^*$. Then:

\[ \Box x \geq \Delta 0, \text{ if and only if } \nabla x = 1 \]
\[ \Box x = 0, \text{ if and only if } \nabla x = 0 \]

For any $x, y$, either $\Box x \leq \Box y$, or $\Box y \leq \Box x$

\[ \Delta x = \Delta \Box x \]
\[ \nabla 0 = 0, \ nabla 1 = 1 \]
\[ \Box x \geq \Delta 0, \text{ if and only if } \Box \neg x = 0 \]
\[ \Box x = 0, \text{ if and only if } \Box \neg x \geq \Delta 0 \]

**Proof.** The proof is almost obvious by construction of the algebra $\mathcal{M}^*$. $\square$

Let us mention the following observation:

**Remark 1.** Any formula $F$ is parametrically expressible in the logic $L\mathcal{D}$ of any Magari’s algebra $\mathcal{D}$ via formulas $p \& q, p \lor q, p \supset q, \neg p, \Delta q$. 

Let us consider on $\mathfrak{D}$ the following formulas (16) and (17), denoted by $F_\sim(p,q,r)$ and $F_{\Delta}(p,q,r)$ correspondingly:

\begin{align}
(\nabla\sim(p\sim q) & \land ((\neg p\sim q)\sim r)) \lor (\nabla(p\sim q) \land \neg \Delta^i \emptyset) & \quad (16) \\
(\nabla q & \land ((\Delta p\sim q)\sim r)) \lor (\neg \nabla q \land \neg \Delta^i \emptyset) & \quad (17)
\end{align}

**Proposition 2.** Let arbitrary $\alpha, \beta, \xi \in \mathfrak{M}^*$. If $\neg \alpha = \beta$ on $\mathfrak{M}^*$, then

$$F_\sim[p/\alpha, q/\beta, r/\xi] = \xi$$

on $\mathfrak{M}^*$.

**Proof.** Since $\neg \alpha = \beta$ we get $\alpha \sim \beta = 0$, $\neg(\alpha \sim \beta) = 1$ and by (13) we have

$$\nabla(\alpha \sim \beta) = 0, \ \nabla(\sim(\alpha \sim \beta)) = 1,$$

which implies

$$F_\sim[p/\alpha, q/\beta, r/\xi] = (1 \land (1 \sim \xi)) \lor (0 \land \neg \Delta^i \emptyset) = \xi$$

**Proposition 3.** Let arbitrary $\alpha, \beta, \xi \in \mathfrak{M}^*$. If $\neg \alpha \neq \beta$ on $\mathfrak{M}^*$ and $\xi \neq \Delta^i \emptyset$, then

$$F_\sim[p/\alpha, q/\beta, r/\xi] \neq \xi$$

on $\mathfrak{M}^*$.

**Proof.** Since $\neg \alpha \neq \beta$ we get $\neg \alpha \sim \beta \neq 1$, $\alpha \sim \beta \neq 0$ We distinguish two cases:

1) $\Box(\alpha \sim \beta) = 0$, and 2) $\Box(\alpha \sim \beta) \geq \Delta^i \emptyset$.

In case 1) by (15), (9) and (10) we get $\Box(\neg(\alpha \sim \beta)) = \Delta^i \emptyset, \ \Box(\neg(\alpha \sim \beta)) = 1$, and $\nabla(\alpha \sim \beta) = 0$, which implies

$$F_\sim[p/\alpha, q/\beta, r/\xi] = (1 \land (\neg(\alpha \sim \beta) \sim \xi)) \lor (0 \land \neg \Delta^i \emptyset) = (\neg(\alpha \sim \beta) \sim \xi \neq \xi,$$

Thus the first case is already examined.

Now consider the second case, when $\Box x \geq \Delta^i \emptyset$. Again, since $\neg \alpha \neq \beta$ by (9), (10) and (14) we obtain $\Box(\neg(\alpha \sim \beta)) = 0, \ \nabla(\alpha \sim \beta) = 0, \ \nabla(\alpha \sim \beta) = 1$. Then,

$$F_\sim[p/\alpha, q/\beta, r/\xi] = (\nabla(\neg(\alpha \sim \beta) \land (\neg(\alpha \sim \beta) \sim \xi)) \lor (\nabla(\alpha \sim \beta) \land \neg \Delta^i \emptyset)$$

$$= (0 \land (\neg(\alpha \sim \beta) \sim \xi)) \lor (1 \land \neg \Delta^i \emptyset) = \neg \Delta^i \emptyset \neq \xi.$$
Proposition 4. Let arbitrary $\alpha, \beta, \eta \in \mathcal{M}^*$ such that $\Delta \alpha = \beta$. Then

$$F_\Delta [p/\alpha, q/\beta, r/\eta] = \eta$$

Proof. Since $\Delta \alpha \geq 0$ and $\Delta \alpha = \beta$ we have $\square \beta \geq \Delta 0$, $\Delta \alpha \sim \beta = 1$ and by (9) we get $\nabla \beta = 1$, $\neg \nabla \beta = 0$. These ones imply the following relations:

$$F_\Delta [p/\alpha, q/\beta, r/\eta] = (\nabla \beta \& ((\Delta \alpha \sim \beta) \sim \eta)) \lor (\neg \nabla \beta \& \neg \Delta^i 0)$$

$$= (1 \& (1 \sim \eta)) \lor (0 \& \neg \Delta^i 0) = 1 \sim \eta = \eta$$

Proposition 5. Let arbitrary $\alpha, \beta, \eta \in \mathcal{M}^*$ such that $\Delta \alpha \neq \beta$ and $\eta \neq \neg \Delta^i 0$. Then

$$F_\Delta [p/\alpha, q/\beta, r/\eta] \neq \eta$$

Proof. We consider 2 cases: 1) $\square \beta = 0$, and 2) $\square \beta \geq \Delta 0$.

Suppose $\square \beta = 0$. In view of (10) we have $\nabla \beta = 0$ and $\neg \nabla \beta = 1$. Subsequently,

$$F_\Delta [p/\alpha, q/\beta, r/\eta] = (\nabla \beta \& ((\Delta \alpha \sim \beta) \sim \eta)) \lor (\neg \nabla \beta \& \neg \Delta^i 0)$$

$$= (0 \& ((\Delta \alpha \sim \beta) \sim \eta)) \lor (1 \& \neg \Delta^i 0)$$

$$= 0 \lor \neg \Delta^i 0 = \neg \Delta^i 0 \neq \eta$$

Suppose now $\square \beta \geq \Delta 0$. Let us note $\Delta \alpha \sim \beta \neq 1$. Then considering (9) we get

$$F_\Delta [p/\alpha, q/\beta, r/\eta] = (\nabla \beta \& ((\Delta \alpha \sim \beta) \sim \eta)) \lor (\neg \nabla \beta \& \neg \Delta^i 0)$$

$$= (1 \& ((\Delta \alpha \sim \beta) \sim \eta)) \lor (0 \& \neg \Delta^i 0)$$

$$= (\Delta \alpha \sim \beta) \sim \eta \neq \eta$$

Proposition 6. Let arbitrary $\alpha, \xi \in \mathcal{M}^*$. Then

$$F_\neg [p/\alpha, q/\alpha, r/\xi] = \neg \Delta^i 0$$

Proof. Let us calculate $F_\neg [p/\alpha, q/\alpha, r/r]$. By (13) we obtain immediately:

$$F_\neg [p/\alpha, q/\alpha, r/\xi] = (\neg (\alpha \sim \alpha) \& ((\neg \alpha \sim \alpha) \& \xi)) \lor (\nabla(\alpha \sim \alpha) \& \neg \Delta^i 0)$$

$$= (0 \& (0 \& \xi)) \lor (1 \& \neg \Delta^i 0) = \neg \Delta^i 0.$$
Proposition 7. Let arbitrary \( \alpha, \eta \in \mathfrak{M}^* \) and \( \square \alpha = 0 \). Then
\[
F_\Delta[p/\alpha, q/\alpha, r/\eta] = -\Delta^i 0.
\]

Proof. Taking into account (10) we have
\[
F_\Delta[p/\alpha, q/\alpha, r/\eta] = (\nabla \alpha \land ((\nabla \alpha \sim \alpha) \sim \eta)) \lor (\neg \nabla \alpha \land \neg \Delta^i 0)
= (0 \land ((\nabla \alpha \sim \alpha) \sim \eta)) \lor (0 \land \neg \Delta^i 0) = 0 \lor \neg \Delta^i 0 = \neg \Delta^i 0.
\]

\[\square\]

4 Some properties of some classes of formulas in \( \mathcal{L} \mathcal{M}^* \)

Consider the class \( K_i, i = 1, 2, \ldots \), of all formulas of \( \mathcal{G} \mathcal{L} \) which conserves the relation \( x = \neg \Delta^i 0 \) on \( \mathfrak{M}^* \). For example, the class \( K_1 \) is defined by the relation \( x = (0, 1, 1, 1, \ldots) \).

Remark 2. The formulas \( \square p, p \land q, p \lor q, \neg \Delta^i 0 \in K_i \), and \( \neg p, \Delta p \notin K_i \).

As a consequence from [6] we have the following remark.

Remark 3. The class \( K_i, i = 1, 2, \ldots \), of formulas is closed with respect to parametric expressibility of formulas in the logic \( \mathcal{L} \mathcal{M}^* \).

Remark 4. Since \( K_i \) is closed relativ to parametric expressibility the formulas \( \neg p \) and \( \Delta p \) can not be expressed parametrically via formulas of \( K_i, K_i \) in \( \mathcal{L} \mathcal{M}^* \), so \( K_i \) is not complete relative to parametric expressibility of formulas in \( \mathcal{L} \mathcal{M}^* \).

Remark 5. By propositions 6 and 7 we have the earlier defined formulas \( F_\neg(p, q, r) \) and \( F_\Delta(p, q, r) \) are in \( K_i \).

Lemma 1. Consider an arbitrary formula \( F(p_1, \ldots, p_k) \notin K_i \). Then formulas \( \Delta p \) and \( \neg p \) are parametrically expressible via formulas from \( K_i \cup \{ F(p_1, \ldots, p_k) \} \)

Proof. Let us note, since \( F \notin K_i \), we have \( F(\neg \Delta^i 0, \ldots, \neg \Delta^i 0) \neq \neg \Delta^i 0 \). Consider formulas \( F'_\neg \) and \( F'_\Delta \) defined by formulas (18) and (19):
\[
(\nabla (\neg p \sim q) \land ((\neg p \sim q) \sim F(\neg \Delta^i 0, \ldots, \neg \Delta^i 0)) \lor (\nabla p \sim q) \land \neg \Delta^i 0) \ (18)
(\nabla q \land ((\nabla p \sim q) \sim F(\neg \Delta^i 0, \ldots, \neg \Delta^i 0)) \lor (\nabla q \land \neg \Delta^i 0) \ (19)
\]
and examine first-order formulas containing only formulas from \( K_i \cup \{ F \} \):
\[
(F'_\neg(p, q) = F(\neg \Delta^i 0, \ldots, \neg \Delta^i 0)) \text{ and } (F'_\Delta(p, q) = F(\neg \Delta^i 0, \ldots, \neg \Delta^i 0))
\]
Let us note by propositions 2 and 3 we have \( \neg p = q \) if and only if \( (F'_\neg(p, q) = F(\neg \Delta^i 0, \ldots, \neg \Delta^i 0)) \) and according to propositions 4 and 5 we get \( (\Delta p = q) \) if and only if \( F'_\Delta(p, q) = F(\neg \Delta^i 0, \ldots, \neg \Delta^i 0) \).

Lemma is proved. \[\square\]
5 Main result

Theorem 1. Consider the extension $L\mathfrak{M}^*$ of the propositional provability logic $GL$. Then there are infinitely many precomplete with respect to parametrical expressibility classes of formulas in $L\mathfrak{M}^*$.

Proof. Consider classes of formulas $K_1, K_2, \ldots$ each of which preserve on the algebra $\mathfrak{M}^*$ the corresponding predicates $x = \neg \Delta 0, x = \neg \Delta^2 0, \ldots$. According to remark 2 these classes are two by two distinct, and by lemma 1 these classes are precomplete relative to parametric expressibility of formulas in $L\mathfrak{M}^*$. □
