Abstract. In this paper, under some structural assumptions of weight function \( b(x) \) and nonlinear term \( f(u) \), we establish the asymptotic behavior and uniqueness of boundary blow-up solutions to semilinear elliptic equations

\[
\begin{aligned}
\Delta u &= b(x)f(u), \quad x \in \Omega, \\
u(x) &= \infty, \quad x \in \partial \Omega,
\end{aligned}
\]

where \( \Omega \subset \mathbb{R}^N \) is a bounded smooth domain. Our analysis is based on the Karamata regular variation theory and the López-Gómez localization method.

Keywords: boundary blow-up solutions, asymptotic behavior, López-Gómez localization method, Karamata regular variation theory.

1 Introduction and main results

In this paper, we deal with the asymptotic behavior of boundary blow-up solutions to semilinear elliptic equations

\[
\begin{aligned}
\Delta u &= b(x)f(u), \quad x \in \Omega, \\
u(x) &= \infty, \quad x \in \partial \Omega,
\end{aligned}
\]

where \( \Omega \subset \mathbb{R}^N \) \( (N \geq 3) \) is a bounded smooth domain, weight function \( b(x) \) satisfies

\((b_1)\) there exists a positive nondecreasing function \( a(x) \in C([0, \delta]) \) such that

\[
\lim_{d(x) \to 0} \frac{b(x)}{a(d(x))} = 1,
\]

where

\[
\frac{1}{a(r)} \int_0^r a(s) \, ds \in C^1([0, \delta]);
\]

Corresponding author. Email: tianqiaoyu2004@163.com
(b2) for any \( x_0 \in \partial \Omega \), there exists \( \tau > 0 \), such that \( b(x) \in C^1(\Omega_\tau(x_0) \cap \Omega) \) satisfies

\[
b_{x_0}(r) \in C^1((0, \tau)), \quad b_{x_0}'(r) > 0 \quad \text{for each } r \in (0, \tau),
\]

and

\[
\lim_{r \to 0} \frac{b_{x_0}(r)}{b_{x_0}(r)} = 1,
\]

where \( \Omega_\tau(x_0) \) is a ball in \( \mathbb{R}^N \) of radius \( \tau \) centered at \( x_0 \), boundary normal sections \( b_x(r) \) defined as

\[
b_x(r) = b(x - rn_x), \quad r > 0, \ r \sim 0,
\]

where \( n_x \) stands for the outward unit normal vector at \( x \in \partial \Omega \).

The nonlinear term \( f(u) \) satisfies

(f1) \( f \geq 0 \) is locally Lipschitz continuous on \( [0, \infty) \) and \( f(u)/u \) is increasing on \( (0, \infty) \);

(f2) there exist some \( \mathcal{L} \in C^2([A, \infty)) \) satisfying \( \lim_{u \to 0} \mathcal{L}(u) = \infty \) if \( r = 1 \) and \( \mathcal{L}' \in NRV_r(0 \leq r \leq 1) \), a slowly varying function \( \mathcal{L} \) and \( p \geq 0 \) such that

\[
\lim_{u \to \infty} \frac{f(\mathcal{L}(u))}{L''(u)u^{p+r}} = 1,
\]

where \( p > 1-r \) if \( 0 \leq r < 1 \) and \( p \geq 0 \) if \( r = 1 \).

The main result of this paper is the following theorem.

**Theorem 1.1.** Suppose that \( b(x) \) satisfies (b1)–(b2) and \( f(u) \) satisfies (f1)–(f2). Then, problem (1.1) possesses a unique positive solution \( u(x) \). Moreover, for each \( x_0 \in \partial \Omega \), any positive solution \( u(x) \) satisfies

\[
\lim_{r \to 0} \frac{u(x_0 - rn_{x_0})}{L(x_0)^{\frac{1}{p-1}} \mathcal{L}(\Phi_{x_0}(d(x)))} = \left( \frac{p+1}{p-1} \right)^{\frac{1}{p-1}},
\]

where

\[
\Phi_{x_0}(t) = \int_t^\infty \left[ \int_0^s \frac{\mathcal{L}''(\Phi_{x_0})}{\mathcal{L}'(\Phi_{x_0})} \right]^{\frac{1}{p+1}} ds,
\]

\[
L(x_0) = \lim_{t \to 0} \frac{\Phi_{x_0}(t)\Phi''_{x_0}(t)}{[\Phi'_x(t)]^2},
\]

\( \mathcal{L}, \mathcal{L} \) appear in (1.6) and \( b_{x_0} \) is defined by (1.5).

The interest in these problems goes back to the pioneering works of López-Gómez. Precisely, López-Gómez [11], used the so-called López-Gómez’s localization method, ascertained asymptotic behavior of boundary blow-up solutions to problem (1.1) with \( f(u) = u^p \) and \( b(x) \) vanishing on the boundary of the underlying domain at different rates according to the point of boundary. This results was developed by López-Gómez [12], Cano-Casanova and López-Gómez [1, 2], Wei and Zhu [18], Wang and Wang [19] and Xie [20]. In particular, Huang et. al. [10] obtained asymptotic behavior of boundary blow-up solutions to problem (1.1) with nonlinear term \( f \) satisfying
Thus, taking into account

\[ \lim_{u \to -\infty} \frac{f(u)}{H(u)u^p} = 1. \quad (1.10) \]

**Remark 1.2.** Note that \((f_3)\) implies that \(f(u) \in RV_p\), see Remark 1.1 of [10]. It can easily be seen that \(f(L(u)) \in RV_p\) if \((f_2)\) holds. Thus \(f\) is a normalized varying function at infinity with index \(p/(1-r)\) if \(0 \leq r < 1\) and \(f\) is rapidly varying with index \(\infty\) if \(r = 1\), for more details see [9]. Consequently, the main results of this paper give a unified asymptotic behavior of boundary blow-up solutions to problem \((1.1)\).

**Remark 1.3.** Based on the results of López-Gómez [1,2,11,12], Ouyang and Xie [13,14], Xie [20], Xie and Zhao [21] established some similar asymptotic behavior of boundary blow-up solutions to problem \((1.1)\). Recently, Huang et. al. [8], using the Karamata regular variation theory approach introduced by Cîrstea and Rădulescu [5, 6], established asymptotic behavior and uniqueness of boundary blow-up solutions to problem \((1.1)\) with \(f\) satisfying \((f_3)\), extended the main results of [13,14,20]. Similarly, we can obtain similar asymptotic behavior of boundary blow-up solutions to problem \((1.1)\) with \(f\) satisfying \((f_2)\).

**Remark 1.4.** For the existence of boundary blow-up solutions to problem \((1.1)\), see Theorem 1.1 of [4].

**Remark 1.5.** One easily sees that \(\Phi_{x_0}(t)\), defined by \((1.8)\), is a decreasing \(C^2\)-function on some interval \((0, \zeta)\), for some \(\zeta > 0\). Consequently, taking into account Lemma 3.1 in [3], \(I(x_0) \geq 1\). Furthermore, \(-\Phi_x^\prime(t)\) is normalized regularly varying at zero of index \(I(x_0)/(1-I(x_0))\) if \(I(x_0) > 1\) and \(\Phi_{x_0}(t)\) has a representation formula if \(I(x_0) = 1\).

**Remark 1.6.** By \((1.8)\), we know that

\[ \Phi_x^\prime(t) = -\left[ \int_0^t \left( \frac{\mathcal{L}''(\Phi_{x_0}(t))b_{x_0}}{\mathcal{L}'(\Phi_{x_0}(t))} \right) \right]^{\frac{1}{p+r-1}}, \quad (1.11) \]

and

\[ \Phi_x''(t) = \frac{p+r+1}{p+r-1} \left[ \int_0^t \left( \frac{\mathcal{L}''(\Phi_{x_0}(t))b_{x_0}}{\mathcal{L}'(\Phi_{x_0}(t))} \right) \right]^{\frac{1}{p+r-1}} \left( \frac{\mathcal{L}'(\Phi_{x_0}(t))b_{x_0}}{\mathcal{L}'(\Phi_{x_0}(t))} \right) ^ {\frac{1}{p+r-1}}. \quad (1.12) \]

Thus, taking into account \((f_2)\) and \(\lim_{t \to 0} \Phi_{x_0}(t) = \infty\), we obtain

\[ \lim_{t \to 0} \frac{\Phi_x''(t)\mathcal{L}'(\Phi_{x_0}(t))}{b_{x_0}(t)f(\mathcal{L}(\Phi_{x_0}(t)))} = \lim_{t \to 0} \frac{\mathcal{L}''(\Phi_{x_0}(t))\Phi_x^{p+r}(t)}{f(\mathcal{L}(\Phi_{x_0}(t)))} \left[ \frac{\Phi_{x_0}(t)\Phi_x''(t)}{\Phi_x''(t)} \right]^{-(p+r)} \frac{\Phi_x''(t)^{p+r+1}}{\Phi_{x_0}(t)^{2(p+r)}\mathcal{L}'(\Phi_{x_0}(t))b_{x_0}(t)} \]

\[ = \left[ I(x_0) \right]^{-(p+r)} \left( \frac{p+r+1}{p+r-1} \right)^{p+r+1}, \]

\[ = \left[ I(x_0) \right]^{-(p+r)} \left( \frac{p+r+1}{p+r-1} \right)^{p+r+1}. \]
and
\[
\lim_{t \to 0} \frac{(\Phi'_{x_0}(t))^2 \mathcal{L}''(\Phi_{x_0}(t))}{b_{x_0}(t)f(\mathcal{L}(\Phi_{x_0}(t)))} \\
= \lim_{t \to 0} \frac{\Phi_{x_0}(t)\mathcal{L}''(\Phi_{x_0}(t))}{\mathcal{L}'(\Phi_{x_0}(t))} \frac{\mathcal{L}'(\Phi_{x_0}(t))}{f(\mathcal{L}(\Phi_{x_0}(t)))} \left[ \frac{\Phi_{x_0}(t)\Phi_{x_0}''(t)}{[\Phi_{x_0}'(t)]^2} \right]^{-(p+r+1)} \\
x \times \frac{[\Phi_{x_0}''(t)]^{p+r+1} \mathcal{L}'(\Phi_{x_0}(t))}{[\Phi_{x_0}'(t)]^{2(p+r)} \mathcal{L}''(\Phi_{x_0}(t))b_{x_0}(t)} \\
= -r[I(x_0)]^{-(p+r+1)} \left( \frac{p + r + 1}{p + r - 1} \right)^{p+r+1}.
\]

The structure of this paper is as follows. In Section 2, we collect some preliminary results of Karamata regular variation theory. In Section 3 we prove some auxiliary results. Theorem 1.1 will be proved in Section 4.

## 2 Auxiliary results

The main purpose of this section is to provide some concepts from the theory of regular variation. For detailed accounts of the theory of regular variation, its extensions and many of its applications, we refer the interested reader to [7,15–17]. When the regular variation occurs at infinity and there is no possibility of confusion, we omit “at infinity”.

**Definition 2.1.** A positive measurable function \( f \) defined on \([D, \infty)\) for some \( D > 0 \) is called regularly varying (at infinity) with index \( p \in \mathbb{R} \) (written \( f \in RV_p \)) if for all \( \xi > 0 \)

\[
\lim_{u \to \infty} \frac{f(\xi u)}{f(u)} = \xi^p.
\]

When the index of regular variation \( p \) is zero, we say that the function is slowly varying. The transformation \( f(u) = u^p L(u) \) reduces regular variation to slow variation.

**Proposition 2.2.** Assume that \( L \) is slowly varying. Then the convergence \( L(\xi u)/L(u) \to 1 \) as \( u \to \infty \) holds uniformly on each compact \( \varepsilon \)-set in \((0, \infty)\).

**Proposition 2.3.** If \( L \) is slowly varying, then

(i) \( \ln L(u)/\ln u \to 0 \) as \( u \to \infty \);

(ii) for any \( \alpha > 0 \), \( u^\alpha L(u) \to \infty, u^{-\alpha} L(u) \to 0 \) as \( u \to \infty \);

(iii) \( (L(u))^\alpha \) varies slowly for every \( \alpha \in \mathbb{R} \);

(iv) if \( L_1 \) varies slowly, so do \( L(u)L_1(u) \) and \( L(u) + L_1(u) \).

Now we collect some important results which will be used in the proof of Theorem 1.1.

**Definition 2.4.** A function \( \underline{u} \in C^2(\Omega) \) is a (classical) subsolution to problem (1.1), if \( \underline{u} = +\infty \) on \( \partial \Omega \) and

\[
\Delta \underline{u} \geq b(x)f(\underline{u}), \quad x \in \Omega.
\]

Similarly, \( \overline{u} \) is a (classical) supersolution to problem (1.1), if \( \overline{u} = +\infty \) on \( \partial \Omega \) and

\[
\Delta \overline{u} \leq b(x)f(\overline{u}), \quad x \in \Omega.
\]
The following comparison principle which plays an important role in the proof of Theorem 1.1 will be used in later sections.

**Proposition 2.5.** Let \( f \) be continuous on \((0, \infty)\) such that \( f(u)/u \) is increasing for \( u > 0 \). Let \( b(x) \in C(\Omega) \) be a nonnegative function. Assume that \( u_1, u_2 \in C^2(\Omega) \) are positive such that

\[
\begin{aligned}
\Delta u_1 - b(x)f(u_1) &\leq 0 \leq \Delta u_2 - b(x)f(u_2), \quad x \in \Omega, \\
\limsup_{d(x, \partial \Omega) \to 0}(u_2 - u_1)(x) &\leq 0.
\end{aligned}
\]

Then we have \( u_1 \geq u_2 \) in \( \Omega \).

### 3 Auxiliary results

To prove Theorem 1.1 by the López-Gómez localization method, firstly consider the corresponding singular problem with radial weight function \( b(x) \) in a ball or an annular domain. Note that, in this case, (3.2) is uniformly satisfied on \( \partial \Omega \).

**Theorem 3.1.** Suppose \( \Omega_r(x_0) = \{x \in \mathbb{R}^N : |x - x_0| < r\} \), \( f(u) \) satisfies (f1)-(f2), and \( b(x) = b(r - \|x - x_0\|), b \in C([0, r] : [0, \infty)) \) satisfies \((b_1)\). Then, problem (1.1) possesses a unique positive solution \( u(x) \). Moreover, any positive solution \( u(x) \) satisfies

\[
\lim_{d(x) \to 0} \frac{u(x)}{\Phi(d(x))} = I^{-\frac{p}{p-1}} \left( \frac{p+1}{p-1} \right)^{-\frac{p+1}{p-1}},
\]

where

\[
I = \lim_{t \to 0} \frac{\Phi(t)\Phi''(t)}{[\Phi'(t)]^2}, \quad \Phi(t) = \int_t^\infty \left[ \int_0^s \left( \frac{\mathcal{L}(\Phi)\varphi}{\mathcal{L}(\Phi)} \right)^{\frac{1}{p-1}} \right]^{-\frac{p+1}{p-1}} \, ds,
\]

\( \mathcal{L}, \mathcal{L} \) appear in (1.6) and \( a \) appears in \((b_1)\).

Similarly, we have the following corresponding results when \( \Omega = \Omega_{r_1,r_2}(x_0) = \{x \in \mathbb{R}^N : r_1 < |x - x_0| < r_2\} \).

**Theorem 3.2.** Suppose \( \Omega = \Omega_{r_1,r_2}(x_0) \), \( f(u) \) satisfies (f1)-(f2), and \( b(x) = b(r_2 - \|x - x_0\|), b \in C([0, r] : [0, \infty)) \) satisfies \((b_1)\). Then problem (1.1) possesses a unique positive solution \( u(x) \) and (3.1) holds.

Note that, when the domain is an annular domain,

\[
d(x) = \begin{cases} 
    r_2 - |x - x_0|, & (r_1 + r_2)/2 \leq |x - x_0| < r_2, \\
    |x - x_0| - r_1, & r_1 \leq |x - x_0| < (r_1 + r_2)/2.
\end{cases}
\]

In the following, the proof of Theorem 3.1 will be given. Theorem 3.2 can be proved by similar arguments, more details are omitted here.

**Proof of Theorem 3.1.** It is interesting to note that (1.2) holds uniformly, for each \( \epsilon > 0 \); choose \( \delta > 0 \) sufficiently small such that

\[
(1 - \epsilon)a(d(x) - \beta) < b(x) < (1 + \epsilon)a(d(x) + \beta), \quad 0 < \beta < d(x) < \delta.
\]
For fixed $\beta \in (0, \delta)$, define $u_{\pm}(x) = L(\xi^\pm \Phi(d(x) \pm \beta))$, $x \in \Omega^\pm_{\beta}$, where $u(x)$ is the solution to problem (1.1), $\Phi(t)$ is defined by (3.2), $\Omega_{\delta} = \{x \in \Omega, 0 < d(x) < \delta\}$, $\Omega^\pm_{\beta} = \Omega_{2\delta - \beta}$, and

$$\bar{\sigma}^\pm = \left[ 1 \pm \epsilon \left( \frac{p + 1}{p - 1} \right)^{\frac{p+1}{p}} \right].$$

Consequently,

$$\nabla u_{\pm}(x) = \xi^\pm L' (\xi^\pm \Phi(d(x) \pm \beta)) \Phi'(d(x) \pm \beta) \nabla d(x),$$

$$\Delta u_{\pm}(x) = (\xi^+)^2 \Phi'(d(x) \pm \beta))^2 + \xi^+ L' (\xi^+ \Phi(d(x) \pm \beta)) \Phi'(d(x) \pm \beta) \nabla d(x) - (1 + \epsilon) a(d(x) + \beta) f(u_{\pm}(x))$$

Thus,

$$\Delta u_{\pm}(x) - b(x) f(u_{\pm}(x))$$

$$\geq (\xi^+)^2 \Phi'(d(x) \pm \beta))^2 + \xi^+ L' (\xi^+ \Phi(d(x) \pm \beta)) \Phi'(d(x) \pm \beta) \nabla d(x) - (1 + \epsilon) a(d(x) + \beta) f(u_{\pm}(x))$$

and

$$\Delta u_{-}(x) - b(x) f(u_{-}(x))$$

$$\leq (\xi^-)^2 \Phi'(d(x) \pm \beta))^2 + \xi^- L' (\xi^- \Phi(d(x) \pm \beta)) \Phi'(d(x) \pm \beta) \nabla d(x) - (1 - \epsilon) a(d(x) - \beta) f(u_{-}(x))$$

Similar computations as in Remark 1.6 show that

$$\lim_{t \to 0} \sigma^\pm_1(t) = \left[ (\xi^\pm)^2 I^{-}\left( p + r \right) - r(\xi^\pm)^2 I^{-}(p + r + 1) \right] \left( \frac{p + r + 1}{p + r - 1} \right)^{p+r+1},$$

and

$$\lim_{t \to 0} \sigma^\pm_2(t) = \lim_{t \to 0} \frac{\xi^\pm L' (\xi^\pm \Phi(t)) \Phi'(t) \Phi''(t)}{a(t) f(L(\xi^\pm \Phi(t)))} = 0.$$

Consequently,

$$\lim_{d(x) \pm \beta \to 0} [\sigma^\pm_1(d(x) \pm \beta) + \sigma^\pm_2(d(x) \pm \beta) \Delta d(x) - (1 \pm \epsilon)] = \pm \epsilon,$$

which implies that we can choose $\delta > 0$ such that

$$\begin{aligned}
\Delta u^+_\beta - b(x) f(u^+_\beta) &\geq 0, \quad x \in \Omega^+_\beta, \\
\Delta u^-_\beta - b(x) f(u^-_\beta) &\leq 0, \quad x \in \Omega^-_\beta,
\end{aligned}$$
Define $M(2\delta) = \max_{x \in (\Omega \cap \bar{B}(x_0), r \in [0, \mu])} u(x)$, where $u(x)$ is a nonnegative solution of problem (1.1). Obviously, $u(x) \leq M(2\delta) + u_{\beta}$, $x \in \{x \in \Omega : d(x) = 2\delta\}$ and $\lim_{\delta \to 0} [M(2\delta) + u_{\beta}] = \infty$. Namely, $u(x) \leq M(2\delta) + u_{\beta}$, $x \in \partial\Omega^\beta$. On the other hand, $\Delta(M(2\delta) + u_{\beta}) = \Delta u_{\beta} \leq b(x)f(u_{\beta}) \leq b(x)f(M(2\delta) + u_{\beta})$, $x \in \Omega_{\beta}$, the comparison principle of elliptic equations leads to

$$u(x) \leq M(2\delta) + u_{\beta}, \quad x \in \Omega^\beta_{\beta}. \quad (3.3)$$

Define $u^+_{\beta}(x) = \mathcal{L}(\xi^+ \Phi(d(x)))$, $x \in \{x \in \Omega : d(x) = 2\delta - \beta\}$ and $N(2\delta) = \mathcal{L}(\xi^+ \Phi(d(x)))$. It is easy to see that

$$u^+_{\beta}(x) \leq N(2\delta) + u(x), \quad x \in \{x \in \Omega : d(x) = 2\delta - \beta\}, \quad \lim_{\delta \to 0} [u^+_{\beta}(x) - N(2\delta) - u(x)] = -\infty.$$

That is, $u^+_{\beta}(x) \leq N(2\delta) + u(x)$, $x \in \partial\Omega^\beta$. Note that $\Delta(u^+_{\beta}(x) - N(2\delta)) = \Delta u^+_{\beta}(x) \geq b(x)f(u^+_{\beta}) \geq b(x)f(u_{\beta})$. This fact, combined with the comparison principle shows that

$$u^+_{\beta}(x) \leq N(2\delta) + u(x), \quad x \in \Omega_{\beta}^\beta. \quad (3.4)$$

According to (3.3) and (3.4), we find

$$u^+_{\beta}(x) - N(2\delta) \leq u(x) \leq M(2\delta) + u_{\beta}, \quad x \in \Omega^\beta_{\beta} \cap \Omega^\beta_{\beta}.$$

This yields

$$\frac{u^+_{\beta}(x) - N(2\delta)}{\mathcal{L}(\xi^+ \Phi(d(x)))} \leq \frac{u(x)}{\mathcal{L}(\xi^+ \Phi(d(x)))} \leq \frac{M(2\delta) + u_{\beta}}{\mathcal{L}(\xi^+ \Phi(d(x)))}, \quad x \in \Omega^\beta_{\beta} \cap \Omega^\beta_{\beta}. \quad (3.5)$$

Letting $\epsilon \to 0$ and $d(x) \to 0$ in (3.5) leads to (3.1), here we use the fact that $d(x) \to 0$ implies $\beta \to 0$ if $x \in \Omega^\beta_{\beta} \cap \Omega^\beta_{\beta}$. \hfill $\square$

## 4 Proof of Theorem 1.1

In this section, we will prove Theorem 1.1 by the localization method introduced in [11, 12].

**Proof.** Fixed $\epsilon > 0$, according to (1.4), there exist $\rho = \rho(\epsilon) \in (0, \eta)$ and $\mu = \mu(\epsilon)$ such that for each $x \in \partial\Omega \cap \bar{B}(x_0), r \in (0, \mu)$,

$$1 - \epsilon < \frac{b_{\epsilon}(r)}{b_{\epsilon}(r)} \leq \frac{b(x - \rho n_{x_0})}{b(x \rho - \rho n_{x_0})} < 1 + \epsilon. \quad (4.1)$$

Define $\mathcal{B} = \{x - \rho n_{x_0} : x \in \partial\Omega \cap \bar{B}(x_0), r \in [0, \mu]\}$. Note that for each $y \in \mathcal{B} (\rho, \mu$ can be shortened if necessary), there exists a unique $y_0 \in \partial\Omega \cap \bar{B}(x_0)$, and $r(y) \in [0, \mu]$, such that $y = y_0 - r(y)n_{y_0}, r(y) = |y - y_0| = \text{dist}(y, \partial\Omega)$. Furthermore, there exists $r_0 \in (0, \min\{\rho/2, \mu/2\})$, such that $\Omega_{0}(x_0 - r_0 n_{x_0}) \subset \Omega$, and $\Omega_{\sigma}(x_0 - r_0 n_{x_0}) \cap \partial\Omega = \{x_0\}$. Thus there exists $\sigma_0 > 0$ such that for $\sigma \in (0, \sigma_0], \Omega_{\sigma}(x_0 - (r_0 + \sigma)n_{x_0}) \subset \Omega \cap \text{Int} \mathcal{B}$. Consequently, for $\sigma \in (0, \sigma_0]$ and $y \in \bar{\Omega}_{0}(x_0 - (r_0 + \sigma)n_{x_0})$,

$$b(y) = b(y_0 - r(y)n_{y_0}) \geq (1 - \epsilon)b(x_0 - r(y)n_{y_0}) = (1 - \epsilon)b_{\rho_0}(r(y)) \geq (1 - \epsilon)b_{\rho_0}(\text{dist}(y, \partial\Omega_{\sigma}(x_0 - (r_0 + \sigma)n_{x_0}))),$$

which shows that $b(y) \geq (1 - \epsilon)b_{\rho_0}(r_\sigma), \text{ where } r_\sigma = \text{dist}(y, \partial\Omega_{\sigma}(x_0 - (r_0 + \sigma)n_{x_0})).$
Let \( \mathcal{U} \) be the unique solution to problem
\[
\begin{cases}
\Delta u = (1 - \varepsilon)b_{x_0}(r_\sigma) f(u), & x \in \Omega_{r_0}(x_0 - (r_0 + \sigma)\mathbf{n}_{x_0}), \\
u(x) = +\infty, & x \in \partial \Omega_{r_0}(x_0 - (r_0 + \sigma)\mathbf{n}_{x_0}),
\end{cases}
\] (4.2)
where \( \sigma \in [0, \sigma_0] \). Equation (3.1) shows that
\[
\lim_{x \to \partial \Omega_{r_0}(x_0 - (r_0 + \sigma)\mathbf{n}_{x_0})} \frac{U(x)}{K_1(x_0)B_1(r_\sigma)} = (1 - \varepsilon)^\beta,
\]
where
\[
B_1(t) = \int_0^t \int_0^s (H \circ B_1^- \beta(t)) b_{x_0}(t) dt ds, \quad K_1(x_0) = [\beta(\beta + 1)C_{x_0} - \beta]^{\beta}, \quad \beta = \frac{1}{p - 1},
\]
and
\[
C_{x_0} = \lim_{t \to 0} \frac{[B_1'(t)]^2}{B_1(t)B_1^{-\beta}(t)}.
\]
Thus \( u|_{\Omega_{r_0}(x_0 - (r_0 + \sigma)\mathbf{n}_{x_0})} \) is a bounded subsolution of (4.2), hence, for each \( \sigma \in [0, \sigma_0] \) and \( x \in \Omega_{r_0}(x_0 - (r_0 + \sigma)\mathbf{n}_{x_0}) \), \( \bar{u}_\sigma = u|_{\Omega_{r_0}(x_0 - (r_0 + \sigma)\mathbf{n}_{x_0})} \leq \mathcal{U} \), and
\[
\lim_{x \to \partial \Omega_{r_0}(x_0 - (r_0 + \sigma)\mathbf{n}_{x_0})} \frac{\bar{u}_\sigma}{K_1(x_0)B_1(r_\sigma)} \leq (1 - \varepsilon)^\beta.
\]
Letting \( \sigma \to 0 \) gives
\[
\lim_{r \to 0} \frac{u(x_0 - r\mathbf{n}_{x_0})}{K_1(x_0)B_1(r)} \leq (1 - \varepsilon)^\beta.
\]
This is valid for any sufficiently small \( \varepsilon > 0 \), then
\[
\lim_{r \to 0} \frac{u(x_0 - r\mathbf{n}_{x_0})}{K_1(x_0)B_1(r)} \leq 1.
\] (4.3)
For any \( x_0 \in \partial \Omega \), there exist \( 0 < r_1 < r_2 \) and \( \sigma_0 \), such that
\[
\Omega \subset \bigcap_{0 \leq \sigma \leq \sigma_0} \Omega_{r_1, r_2}(x_0 + (r_1 + \sigma)\mathbf{n}_{x_0}), \quad \partial \Omega \cap \Omega_{r_1, r_2}(x_0 + r_1\mathbf{n}_{x_0}) = \{ x_0 \}
\]
and \( r_1 \) is small enough, \( r_2 \) is large enough such that \( \Omega \subset \Omega_{r_1, r_2/3}(x_0 + r_1\mathbf{n}_{x_0}) \).

By (4.1), we find that for each \( y \in \Omega_{2\eta}(x_0) \cap \overline{\Omega} \), where \( \eta \in \min\{\rho, \mu\} \) is small, \( b(y) = b(y_0 - r(y)\mathbf{n}_{y_0}) \leq (1 + \varepsilon)b_{x_0}(r(y)) \leq (1 + \varepsilon)b_{x_0}(\text{dist}(y, \partial \Omega_{r_1}(x_0 + r_1\mathbf{n}_{x_0}))) \). Define the function \( \tilde{b}: \Omega_{r_1, r_2}(x_0 + r_1\mathbf{n}_{x_0}) \to [0, \infty) \) as \( \tilde{b}(y) = \tilde{b}(r) = (1 + \varepsilon)b_{x_0}(r) \), where \( y \in \Omega_{2\eta}(x_0) \cap \overline{\Omega} \) and \( r = \text{dist}(y, \partial \Omega_{r_1, r_2}(x_0 + r_1\mathbf{n}_{x_0})) \). Moreover, \( \tilde{b}(\text{dist}(y, \partial \Omega_{r_1, r_2}(x_0 + (r_1 + \sigma)\mathbf{n}_{x_0})) \geq b(y) \), for each \( y \in \overline{\Omega}, \sigma \in [0, \sigma_0] \).

Let \( \mathcal{U} \) be the unique solution to
\[
\begin{cases}
\Delta u = \tilde{b}(r) f(u), & x \in \Omega_{r_1, r_2}(x_0 + (r_1 + \sigma)\mathbf{n}_{x_0}), \\
u(x) = +\infty, & x \in \partial \Omega_{r_1, r_2}(x_0 + (r_1 + \sigma)\mathbf{n}_{x_0}),
\end{cases}
\]
where \( r = \text{dist}(y, \partial \Omega_{r_1, r_2}(x_0 + (r_1 + \sigma)\mathbf{n}_{x_0})) \), and
\[
\lim_{x \to \partial \Omega_{r_1, r_2}(x_0 + (r_1 + \sigma)\mathbf{n}_{x_0})} \frac{\mathcal{U}(x)}{K_2(x_0)B_2(r)} = (1 + \varepsilon)^\beta.
\]
Asymptotic behavior and uniqueness of boundary blow-up solutions

where

$$B_2(t) = \int_0^t \int_0^s (H \circ B_2^{-\beta}(r))b_{x_0}(r) \, ds \, dt,$$

$$K_2(x_0) = [\beta(\beta + 1)C_{\infty} - \beta]^{\beta}, \quad \beta = \frac{1}{p - 1},$$

$$C_{\infty} = \lim_{t \to 0} \frac{|B'_2(t)|^2}{B_2(t)b_{x_0}(r)H \circ B_2^{-\beta}(t)}.$$

Moreover, $U|_{\Omega}$ is a subsolution of (1.1), this implies that $U(x) \leq u(x)$, for each $\sigma \in [0, \sigma_0]$ and $x \in \Omega_{r_1,r_2}(x_0 + (r_1 + \sigma)n_{x_0}) \cap \Omega$. This yields

$$\lim_{r \to 0} \frac{u(x_0 - rn_{x_0})}{K_2(x_0)B_2(r)} \geq (1 + \varepsilon)^\beta.$$  

Letting $\sigma \to 0$, we derive that

$$\liminf_{x \to x_0} \frac{u(x)}{K_2(x_0)B_2(r)} \geq 1. \quad (4.4)$$

It can easily be seen that $B_1(r) = B_2(r)$ and $K_1(x_0) = K_2(x_0)$. Using (4.3) and (4.4), we obtain (1.7).

\end{proof}
