ABSTRACT. Type and cotype are computed for Banach spaces generated by some positive sublinear operators and Banach function spaces. Applications of the results yield that under certain assumptions Clarkson's inequalities hold in these spaces.

KEY WORDS AND PHRASES. Type, cotype, Clarkson's inequalities.

1991 AMS SUBJECT CLASSIFICATION CODE. Primary, 46B20.

1. INTRODUCTION.

Given a Banach space $X$, we let for any $n \in \mathbb{N}$, $1 \leq p \leq 2 \leq q < \infty$ and $1 \leq s < \infty$, $K_{p,s}^{(r)}(X)$ and $K_{q,s}^{(l)}(X)$ be the smallest constants for which

$$
K_{q,s}^{(l)}(X)^{-1} \left( \sum_{i=1}^{n} \|x_i\|^s \right)^{1/s} \leq \left( \int_{0}^{1} \left| \sum_{i=1}^{n} r_i(t)x_i \right|^q \, ds \right)^{1/q} 
$$

$$
\leq K_{p,s}^{(r)}(X) \left( \sum_{i=1}^{n} \|x_i\|^r \right)^{1/r} \tag{1.1}
$$

for every choice of $\{x_i\}_{i=1}^{n} \subset X$, where $\{r_i\}_{i=1}^{n}$ denotes the sequence of Rademacher functions defined by $r_i(t) = \text{sign} \sin 2^n \pi t$ for $0 \leq t \leq 1$. If the left (resp. the right) inequality in (1.1) holds, $X$ is of cotype $(q,s)$ (resp. type $(p,s)$). If $s = 1$, we say that $X$ is of cotype $q$ (resp. type $p$) (see [6]).

The notions of type and cotype have appeared in various problems involving the analysis of vector valued functions or random variables. One of the great advantages of the classification of Banach spaces in terms of type and cotype is the existence of a rather satisfactory geometric characterization of these notions. For example Maurey and Pisier [8] showed that a Banach space $X$ is of type $p$ for some $p > 1$ (resp. cotype $q$ for some $q < \infty$) iff $X$ does not contain $l_1^s$ (resp. $l_p^s$) uniformly.

Note that if $X$ is of type $(p,p')$ with $K_{p,p'}^{(r)}(X) = 1$, $1 < p \leq 2$ (resp. cotype $(p,p')$ with $K_{p,p'}^{(l)}(X) = 1$, $2 < p < \infty$) and $1/p + 1/p' = 1$, then $X$ verifies Clarkson's inequalities, i.e., for every $x, y \in X$, we have

$$
\left( \frac{1}{2} \|x - y\|^{p'} + \frac{1}{2} \|x + y\|^{p'} \right)^{1/p'} \leq \left( \|x\|^{p'} + \|y\|^{p'} \right)^{1/p'} \tag{1.2}
$$

$$
\text{(resp. } \left( \frac{1}{2} \|x - y\|^{p'} + \frac{1}{2} \|x + y\|^{p'} \right)^{1/p'} \leq \left( \|x\|^{p'} + \|y\|^{p'} \right)^{1/p'} \tag{1.3}
$$

Clearly (1.2), (1.3) implies that $X$ is uniformly convex.
The well-known examples of Banach spaces for which the above inequalities hold are $L_p$-spaces (see [2]), $p$-Schatten ideals of compact operators on Hilbert spaces (see [9]), provided $1 < p < \infty$.

In [10] Milman showed, using interpolation techniques that if $\Omega \subset \mathbb{R}^n$ is a domain with minimally smooth boundary, then the inequality (1.2) applies to Sobolev spaces $W^p_0(\Omega)$ for $1 < p \leq 2$. Further Cobos [3], using the above observation, proved that the inequalities (1.2) and (1.3) hold in $W^p_0(\Omega)$ for every domain $\Omega \subset \mathbb{R}^n$ and $1 < p < \infty$. In the same way Cobos and Edmunds in [4] showed that some Besov spaces and Triebel-Sobolev spaces verify Clarkson’s inequalities.

In this paper we compute the type and cotype for spaces of large class of Banach spaces generated by some positive sublinear operators and Banach function spaces. This class includes for example: interpolation spaces determined by the real method of interpolation, Besov spaces, Triebel-Sobolev spaces (see [1],[11],[12]) $H^s$-spaces, an approximation space, $L^s(\mu, X)$-spaces and the other (see for example [5]). We also show that under some conditions Clarkson’s inequalities hold in these spaces.

2. PRELIMINARIES.

Let $(\Omega, \mu)$ be a complete $\sigma$-finite measure space. If $X$ is a Banach space, we denote by $L(X) = L^1(\mu, X)$ the F-space [i.e., complete and metrizable topological vector space of all equivalence classes of all $\mu$-Bochner measurable $X$-valued functions on $\Omega$. If $X = \mathbb{R}$, then we write $L^1 = L^1(\mu)$.

A Banach space $E \subset L^1$ is called a Banach function space if for almost every $x \in L^1$ and $y \in E$ imply that $x \in E$ and $\|x\|_E = \|y\|_E$.

Recall that a Banach function space $E$ is called $p$-convex (resp. $p$-concave), $1 \leq p < \infty$ if there exists a constant $M$ so that for all $x, \ldots, x_n \in E$, we have

$$\left(\sum_{i=1}^n \|x_i\|_E^p\right)^{1/p} \leq M \left(\sum_{i=1}^n \|x_i\|_E^p\right)^{1/p}$$

(resp. $\left(\sum_{i=1}^n \|x_i\|_E^p\right)^{1/p} \geq M \left(\sum_{i=1}^n \|x_i\|_E^p\right)^{1/p}$).

The smallest possible value of $M$ is denoted by $M_0(E)$ (resp. $M_p(E)$).

In what follows let $X$ be an F-space and let $S$ be a positive sublinear operator defined on $X$ taking values in $L^1 = L^1(\Omega, \mu)$; that is for every $x, y \in X$ and any scalar $\lambda$ the following hold:

(i) $Sx \geq 0$,

(ii) $S(\lambda x) = |\lambda| SX$,

(iii) $S(x + y) \leq SX + SY$.

For a given Banach function space $E \subset L^1$ and injective operator $S : X \rightarrow L^1$, we define

$$D_E(S) = \{x \in X : Sx \in E\}.$$ If $E = (L_p, \|\cdot\|_p)$, we write in short $D_p$ instead of $D_E(S)$, where $\|x\|_p = \left(\int_\Omega |x|^p d\mu\right)^{1/p}$ for $1 \leq p < \infty$.

Throughout the paper, we assume that $D_E(S)$ is a Banach space with the norm defined by

$$\|x\|_{D_E(S)} = \|Sx\|_E.$$ We say that a pair $(E, S)$ is admissible provided that for any $A$ with $\mu(A) < \infty$, we have $\chi_A Sx_n \rightarrow 0$ in $E$ for every sequence $\{x_n\} \subset D_E(S)$ such that $x_n \rightarrow 0$ in $X$. Here $\chi_A$ is a characteristic function of $A$. 

3. RESULTS.

Let \((T, \nu)\) and \((\Omega, \mu)\) be measure spaces. In the sequel for any \(x_1, \ldots, x_n \in \mathcal{X}\) and \(f_1, \ldots, f_n \in L^*(T, \nu)\), we write
\[
\sum_{k=1}^{\infty} f_k \otimes x_k(t) - \sum_{k=1}^{\infty} f_k(t) x_k \quad \text{for} \quad t \in T.
\]
An easy proof of the following lemma may be omitted.

**Lemma 3.1.** Let \(f_1, \ldots, f_n \in L^*(T, \nu)\). Then the following hold:

(i) For all \(x_1, \ldots, x_n \in \mathcal{X}\) and for any \(\omega \in \Omega\)
\[
S\left(\sum_{k=1}^{\infty} f_k \otimes x_k\right)(\omega) \in L^*(T, \nu).
\]

(ii) For all \(x_1, \ldots, x_n \in D_E(S)\),
\[
\left\| \sum_{k=1}^{\infty} f_k \otimes x_k \right\|_{D_E(S)} \in L^*(T, \nu).
\]

(iii) If a measure space \((T, \nu)\) is finite, then for all \(x_1, \ldots, x_n \in \mathcal{X}\) and \(f_1, \ldots, f_n \in L^p\),
\[
\left(\int_T \left(\sum_{k=1}^{\infty} f_k \otimes x_k\right)^p d\nu\right)^{1/p} \in L^*(\Omega, \mu).
\]

**Theorem 3.1.** Assume that \((T, \nu)\) is a finite measure space. Let \(E\) be a Banach function space and let \(f_1, \ldots, f_n \in L^p(T, \nu), \; 1 \leq p < \infty\).

(i) If \(E\) is \(p\)-convex, then for all \(x_1, \ldots, x_n \in \mathcal{X} = D_E(S)\), we have
\[
\left\| \left(\int_T S\left(\sum_{k=1}^{\infty} f_k \otimes x_k\right)^p d\nu\right)^{1/p} \right\|_E \leq M^p(E) \left(\int_T \left(\sum_{k=1}^{\infty} f_k \otimes x_k\right)^p d\nu\right)^{1/p}.
\]

(ii) If \(E\) is \(p\)-concave, then for all \(x_1, \ldots, x_n \in \mathcal{X}\), we have
\[
\left(\int_T \left(\sum_{k=1}^{\infty} f_k \otimes x_k\right)^p d\nu\right)^{1/p} \leq M^p(E) \left(\int_T S\left(\sum_{k=1}^{\infty} f_k \otimes x_k\right)^p d\nu\right)^{1/p}.
\]

**Proof.** First of all, suppose that \(f_k, k = 1, \ldots, n\) are step functions. We can certainly assume that
\[
f_k = \sum_{i=1}^{\infty} c_i \chi_{A_i} \quad \text{with} \quad A_i \subset T \text{ measurable, pairwise disjoint and} \quad T = \bigcup_{i=1}^{\infty} A_i.
\]
Then for \(C = M^p(E)\), we have
\[
\left\| \left(\int_T S\left(\sum_{k=1}^{\infty} f_k \otimes x_k(t)\right)^p dv(t)\right)^{1/p} \right\|_E
\]
\[
- \left\| \left(\int_T \left(S\left(\sum_{k=1}^{\infty} c_i \chi_{A_i}(t) x_k\right)^p dv(t)\right)^{1/p} \right\|_E
\]
\[
- \left\| \left(\int_T \left(S\left(\sum_{k=1}^{\infty} c_i \chi_{A_i}(t) dv(t)\right)^p \right)^{1/p} \right\|_E
\]
\[
- \left\| \left(\sum_{i=1}^{\infty} \nu(A_i)^{1/p} \left(\sum_{k=1}^{\infty} c_i \chi_{A_i}\right)^p \right)^{1/p} \right\|_E \quad \text{(by} \; p \text{-convexity)}
\]
\[
\leq C \left(\sum_{i=1}^{\infty} \nu(A_i) \left\| S\left(\sum_{k=1}^{\infty} c_i \chi_{A_i}\right)^p\right\|_E \right)^{1/p} - C \left(\int_T \left(\sum_{k=1}^{\infty} c_i \chi_{A_i}\right)^p x_k(t) dv(t) \right)^{1/p}
\]
\[
- C \left(\int_T \left(\sum_{k=1}^{\infty} f_k \otimes x_k(t)\right)^p dv(t) \right)^{1/p}.
\]
Now assume that in the sequence \( \{f_k\}_{k=1}^n \), \( f_k \) with \( k = 2, \ldots, n \) are step functions. Take any sequence \( \{g_i\}_{i=1}^n \) of step functions such that \( g_i \to f_i \) \( \nu \)-a.e. on \( T \), and \( g_i \to f_i \) in \( L^\nu(T, \nu) \). From this, we easily get that

\[
aj = \left( \int_T \left( \sum_{i=1}^n f_i \otimes x_i \right)^p d\nu \right)^{1/p} \to \left( \int_T \left( \sum_{i=1}^n f_i \otimes x_i \right)^p d\nu \right)^{1/p}
\]

and

\[
bj = \left( \int_T \left( \sum_{i=1}^n f_i \otimes x_i \right)^p d\nu \right)^{1/p} \to \left( \int_T \left( \sum_{i=1}^n f_i \otimes x_i \right)^p d\nu \right)^{1/p}
\]

Since \( a_j \leq C b_j \) by previously proved inequality, we obtain desired inequality. Thus, by iterating the proof of (i) is complete. The proof of (ii) is similar.

Let us define on a \( F \)-space \( X \) a family of semi-norm \( | \cdot |_\omega \), by \( |x|_\omega = Sx(\omega) \) for every \( \omega \in \Omega \). Now the main theorem of the paper is immediate.

**THEOREM 3.2.** Assume that \( 1 < p < \infty \) and \( 1 \leq s < \infty \). Let \( E \) be a Banach function space and let \( X = D_E(S) \).

(i) If \( E \) is \( p \)-convex, \( 1 < p \leq 2 \), and \( s \)-concave, and for all \( x_1, x_2, \ldots, x_n \in X \)

\[
\left( \int_0^1 \left( \sum_{i=1}^n r_i(t) x_i \right)^p dt \right)^{1/p} \leq C_1 \left( \sum_{i=1}^n |x_i|_\omega^p \right)^{1/p} \quad \mu - a.e.,
\]

(3.1) then \( X \) is of type \( (p, s) \) with \( K^{\mu,p,s}(X) \leq C_1(p, s) = C_1 M_{\mu,p}(E) M_{\mu,s}(E) \).

(ii) If \( E \) is \( p \)-concave, \( 2 \leq p < \infty \), and \( s \)-convex, and for all \( x_1, x_2, \ldots, x_n \in X \)

\[
\left( \sum_{i=1}^n |x_i|_\omega^p \right)^{1/p} \leq C_2 \left( \int_0^1 \left( \sum_{i=1}^n r_i(t) x_i \right)^p dt \right)^{1/p} \quad \mu - a.e.,
\]

(3.2) then \( X \) is of cotype \( (p, s) \) with \( K_{(p,s)} \leq C_2(p, s) = C_2 M_{\mu,p}(E) M_{\mu,s}(E) \).

**COROLLARY 3.1.** If the conditions of Theorem 3.2 are satisfied with \( s = p' \) and \( C_1(p, s) = 1 \) (resp. \( C_2(p, s) = 1 \)), then Clarkson’s inequality (1.2) (resp. (1.3)) holds for \( D_p(S) \).

**PROPOSITION 3.1.** Let \( (L_p, S) \) be an admissible pair, \( 1 \leq p < \infty \). Assume that \( D_p \subset X \) with continuous inclusion and that \( D_p \) is a non-closed subspace in \( X \). Then \( D_p \) is not type \( r \) (resp. cotype \( r \)) for any \( r > p \) (resp. for any \( r < p \)).

**PROOF.** The above assumptions imply that for any \( \varepsilon > 0, D_p \) contains \( (1 + \varepsilon) \)-isomorphic copy of \( L_p \) (see [7]). Since type and cotype is inherited by subspaces, then the proof is finished.

In the theory of type and cotype the type and cotype indices of a Banach space \( B \) which are defined as follows

\[
p(B) = \sup \{ p : B \text{ is of type } p \},
\]

\[
q(B) = \inf \{ q : B \text{ is of cotype } p \}
\]

are important (see [8] for details).
COROLLARY 3.2. Assume that the assumptions of Proposition 3.1 are satisfied. Let $X = D_\mu$.
(i) \[
\text{If } 1 < p \leq 2 \text{ and for all } x_1, \ldots, x_n \in X \]
\[
\left( \int \left| \sum_{i=1}^{m} r_i(t) x_i \right|_{L^p}^{p} dt \right)^{1/p} \leq C \left( \sum_{i=1}^{m} |x_i|_\mu^{p} \right) \mu - a.e.,
\]
then $p(X) = p$.
(ii) \[
\text{If } 2 \leq p < \infty \text{ and for all } x_1, \ldots, x_n \in X \]
\[
\left( \sum_{i=1}^{m} |x_i|_\mu^{p} \right)^{1/p} \leq C \left( \int \left| \sum_{i=1}^{m} r_i(t) x_i \right|_{L^p}^{p} dt \right)^{1/p} \mu - a.e.,
\]
then $q(X) = p$.

PROOF. Since $L_\mu$ is $p$-convex and $p$-concave Banach function space, we have $X$ is of type $(p, p)$ for $1 < p \leq 2$ (resp. cotype $(p, p)$ for $2 \leq p < \infty$) by Theorem 3.2. In order to finish the proof it suffices to apply a result of Kahane (see [6, Theorem 1.e.13]) and Proposition 3.1.

4. EXAMPLES.

We give two general examples injective and positive sublinear operators satisfying the inequalities given in Theorem 3.2.

Let $(\Omega, \mu)$ be a measure space and let $X$ be an $F$-space. Fix $1 < q < \infty$ and assume that $\{T_k\}_{k=1}^\infty$ is a sequence of injective linear operators, $T_k : X \to L^\infty(\Omega, \mu)$, such that
\[
Sx(\omega) = \left( \sum_{k=1}^{\infty} \|T_kx(\omega)\|^{q} \right)^{1/q} < \infty \quad \mu - a.e.
\]
Then obviously the operator $S : X \to L^\infty$ is injective, positive sublinear. For this operator, we have

PROPOSITION 4.1. (i) \[
\text{If } 1 < p \leq q \leq 2, \text{ then for all } x_1, \ldots, x_n \in X \]
\[
\left( \int \left| \sum_{i=1}^{m} r_i(t) x_i \right|_{L^p}^{p} dt \right)^{1/p} \leq \left( \sum_{i=1}^{m} |x_i|_\mu^{p} \right)^{1/p} \mu - a.e.,
\]
(ii) \[
\text{If } 2 \leq q \leq p < \infty, \text{ then for all } x_1, \ldots, x_n \in X \]
\[
\left( \sum_{i=1}^{m} |x_i|_\mu^{p} \right)^{1/p} \leq \left( \int \left| \sum_{i=1}^{m} r_i(t) x_i \right|_{L^p}^{p} dt \right)^{1/p} \mu - a.e.,
\]

PROOF. We have $K_{p, r}(l_q) = 1$ for all $1 < q \leq 2$ and by a duality argument $K^{q, r}(l_q) = 1$ for all $2 < q < \infty$ (see [10]).

Now assume that $1 < p \leq q \leq 2$. Then by $q' \leq p'$, it follows that
\[
\left( \int \left| \sum_{i=1}^{m} r_i(t) x_i \right|_{L^p}^{p^'} dt \right)^{1/p'} \leq \left( \int \left| \sum_{i=1}^{m} r_i(t) \{T_kx(\omega)\} \right|_{L^q}^{q^'} dt \right)^{1/q'} \leq \left( \sum_{i=1}^{m} \|T_kx(\omega)\|_{L^q}^{q} \right)^{1/q} \leq \left( \sum_{i=1}^{m} |x_i|_\mu^{p^'} \right)^{1/p'}
\]
for all \(x_1, \ldots, x_n \in X\). The proof of (ii) is similar.

Let \(X\) be a Banach space and let \(X = L^\infty(\Omega, \mu, X)\). Define an injective, positive sublinear operator \(S: X \to L^\infty(\Omega, \mu)\) by

\[ Sx(\omega) = \|x(\omega)\|_X, \quad \omega \in \Omega. \]

Then the Banach space \(D_k(S)\) is well-known and is denoted by \(E(X)\). Clearly the inequality (3.1) (resp. (3.2)) is equivalent to the fact that \(X\) is of type \((p, s)\) (resp. cotype \((p, s)\)).

Special Issue on
Modeling Experimental Nonlinear Dynamics and Chaotic Scenarios

Call for Papers

Thinking about nonlinearity in engineering areas, up to the 70s, was focused on intentionally built nonlinear parts in order to improve the operational characteristics of a device or system. Keying, saturation, hysteretic phenomena, and dead zones were added to existing devices increasing their behavior diversity and precision. In this context, an intrinsic nonlinearity was treated just as a linear approximation, around equilibrium points.

Inspired on the rediscovering of the richness of nonlinear and chaotic phenomena, engineers started using analytical tools from “Qualitative Theory of Differential Equations,” allowing more precise analysis and synthesis, in order to produce new vital products and services. Bifurcation theory, dynamical systems and chaos started to be part of the mandatory set of tools for design engineers.

This proposed special edition of the Mathematical Problems in Engineering aims to provide a picture of the importance of the bifurcation theory, relating it with nonlinear and chaotic dynamics for natural and engineered systems. Ideas of how this dynamics can be captured through precisely tailored real and numerical experiments and understanding by the combination of specific tools that associate dynamical system theory and geometric tools in a very clever, sophisticated, and at the same time simple and unique analytical environment are the subject of this issue, allowing new methods to design high-precision devices and equipment.
