ON HYPER BCC-ALGEBRAS

R. A. BORZOOEI, W. A. DUDEK, AND N. KOOHESTANI

Received 24 June 2005; Revised 4 June 2006; Accepted 21 June 2006

We study hyper BCC-algebras which are a common generalization of BCC-algebras and hyper BCK-algebras. In particular, we investigate different types of hyper BCC-ideals and describe the relationship among them. Next, we calculate all nonisomorphic 22 hyper BCC-algebras of order 3 of which only three are not hyper BCK-algebras.

1. Introduction

The study of BCK-algebras was initiated by Iséki [7] as a generalization of the concept of set-theoretic difference and propositional calculus. Iséki posed an interesting problem; whether the class of BCK-algebras is a variety. In connection with this problem Komori introduced in [9] a notion of BCC-algebra which is a generalization of a BCK-algebra and proved that the class of all BCC-algebras is not a variety. Dudek [3–5] followed this theory and has got a lot of related results. BCC-algebras are algebraic models of BCC-logic, implicational logic whose axiom schemes are the principal-type schemes of the combinators \( B, I, \) and \( K \), and whose inference rules are modus ponens and modus ponens 2. So, in fact, such algebras ought to have been named BIK-algebras. In this convention, a BCK-algebra is a BCC-algebra satisfying the identity \( y \rightarrow (x \rightarrow z) = x \rightarrow (y \rightarrow z) \).

The hyperstructure theory (called also multialgebras) was introduced by Marty [10] at the eighth congress of Scandinavian mathematicians. Now hyperstructures of different types have many important applications (see, e.g., [1, 2]).

In this paper, we study hyper BCC-algebras which are a common generalization of BCC-algebras and hyper BCK-algebras investigated by many authors. In particular, we investigate different types of hyper BCC-ideals and describe the relationship among them. Next, we calculate all nonisomorphic 22 hyper BCC-algebras of order 3 of which only three are not hyper BCK-algebras.

2. Preliminaries

Definition 2.1. An algebra \( (X, \ast, 0) \) of type \( (2,0) \) is said to be a BCC-algebra if it satisfies the following: for all \( x, y, z \in X \),

\[ x \ast (y \ast z) = (x \ast y) \ast z. \]
2 On hyper BCC-algebras

(I) \((x \ast y) \ast (z \ast y) \ast (x \ast z) = 0\),
(II) \(x \ast 0 = x\),
(III) \(x \ast x = 0\),
(IV) \(0 \ast x = 0\),
(V) \(x \ast y = 0\) and \(y \ast x = 0\) imply \(x = y\).

**Definition 2.2.** By a hyper BCK-algebra, it is meant a nonempty set \(H\) endowed with a hyperoperation “\(\ast\)” and a constant “0” satisfying the following axioms:

\((\text{HK}_1)\) \((x \circ z) \circ (y \circ z) \ll x \circ y\),
\((\text{HK}_2)\) \((x \circ y) \circ z = (x \circ z) \circ y\),
\((\text{HK}_3)\) \(x \ll H \ll \{x\}\),
\((\text{HK}_4)\) \(x \ll y\) and \(y \ll x\) imply \(x = y\)

for all \(x, y, z \in H\), where \(x \ll y\) is defined by \(0 \in x \circ y\) and for every \(A, B \subseteq H\), \(A \ll B\) is defined by for all \(a \in A\), there exists \(b \in B\) such that \(a \ll b\). In such case, “\(\ll\)” is called the hyperorder in \(H\).

**Proposition 2.3** (see [8]). In any hyper BCK-algebra \(H\), for all \(x, y, z \in H\), the following hold:

(i) \(0 \circ 0 = \{0\}\),
(ii) \(0 \circ x = \{0\}\),
(iii) \(x \circ 0 = \{x\}\).

**Definition 2.4.** Let \(I\) be a nonempty subset of a hyper BCK-algebra \(H\) and \(0 \in I\). Then \(I\) is said to be a weak hyper BCK-ideal of \(H\) if \(x \circ y \subseteq I\) and \(y \in I\) imply \(x \in I\) for all \(x, y \in H\), hyper BCK-ideal of \(H\) if \(x \circ y \ll I\) and \(y \in I\) imply \(x \in I\) for all \(x, y \in H\), strong hyper BCK-ideal of \(H\) if \((x \circ y) \cap I \neq \emptyset\) and \(y \in I\) imply \(x \in I\) for all \(x, y \in H\), hyper subalgebra of \(H\) if \(x \circ y \subseteq I\) for all \(x, y \in I\).

3. Hyper BCC-algebras

**Definition 3.1.** By a hyper BCC-algebra, it is meant a nonempty set \(H\) endowed with a hyperoperation “\(\circ\)” and a constant 0 satisfying the following axioms:

\((\text{HC}_1)\) \((x \circ z) \circ (y \circ z) \ll x \circ y\),
\((\text{HC}_2)\) \(0 \circ x = \{0\}\),
\((\text{HC}_3)\) \(x \circ 0 = \{x\}\),
\((\text{HC}_4)\) \(x \ll y\) and \(y \ll x\) imply \(x = y\)

for all \(x, y, z \in H\), where \(x \ll y\) is defined by \(0 \in x \circ y\) and for every \(A, B \subseteq H\), \(A \ll B\) is defined by for all \(a \in A\), there exists \(b \in B\) such that \(a \ll b\). In such case, “\(\ll\)” is called the hyperorder in \(H\).

**Example 3.2.** (i) Let \((H, \ast, 0)\) be a BCC-algebra and define a hyper operation “\(\circ\)” on \(H\) by \(x \circ y = \{x \ast y\}\) for all \(x, y \in H\). Then \((H, \circ)\) is a hyper BCC-algebra.

(ii) Let \(H = \{0, 1, 2, 3, \ldots\}\) and hyper operation “\(\circ\)” on \(H\) is defined as follows:

\[
x \circ y = \begin{cases} 
\{0, x\} & \text{if } x \leq y, \\
\{x\} & \text{if } x > y
\end{cases}
\]  (3.1)

for all \(x, y \in H\). Then \((H, \circ)\) is a hyper BCC-algebra.

(iii) Let \( H_1 = \{0,1,2,3\}, H_2 = \{0,1,2\} \), and hyper operations “\( \circ_1 \)” and “\( \circ_2 \)”, respectively, on \( H_1 \) and \( H_2 \) be defined as in Tables 3.1 and 3.2.

Then \( (H_1, \circ_1) \) and \( (H_2, \circ_2) \) are hyper BCC-algebras.

**Theorem 3.3.** Any hyper BCK-algebra is a hyper BCC-algebra.

**Proof.** The proof follows from (HK\(_1\)), (HK\(_4\)), and Proposition 2.3(ii) and (iii). \( \square \)

The converse of Theorem 3.3 is not true in general. As it is not difficult to see in Example 3.2(iii) that \( H_1 \) and \( H_2 \) are hyper BCC-algebras but they are not hyper BCK-algebras because \( (2 \circ 1) \circ 2 \neq (2 \circ 2) \circ 1 \).

**Definition 3.4.** Hyper BCC-algebra \( H \) is called a proper hyper BCC-algebra if \( H \) is not a hyper BCK-algebra.

**Proposition 3.5.** Let \( H \) be a hyper BCC-algebra. Then for all \( x, y, z \in H \) and \( A \subseteq H \) the following statements hold:

(i) \( 0 \circ 0 = \{0\} \),
(ii) \( 0 \ll x \),
(iii) \( x \ll x \),
(iv) \( x \circ y \ll \{x\} \),
(v) \( A \circ 0 = A \),
(vi) \( 0 \circ A = \{0\} \),
(vii) \( x \circ y = \{0\} \) implies \( x \circ z \ll y \circ z \).

**Proof.** (i) In (HC\(_2\)), let \( x = 0 \). Then \( 0 \circ 0 = \{0\} \).

(ii) By (HC\(_2\)), \( 0 \in 0 \circ x \) and so \( 0 \ll x \).

(iii) In (HC\(_1\)), let \( y = z = 0 \). Then by (i) and (HC\(_3\)), we get that \( x \ll x \).

(iv) By (HC\(_1\)), we conclude that \( (x \circ y) \circ (z \circ y) \ll x \circ z \). Now, let \( z = 0 \). Then by (HC\(_2\)) and (HC\(_3\)), we get that \( x \circ y \ll \{x\} \).

(v) The proof follows by (HC\(_3\)).

(vi) The proof follows by (HC\(_2\)).
4 On hyper BCC-algebras

(vii) Let \( x \circ y = \{0\} \). Since by (HC\(_1\)), \( (x \circ z) \circ (y \circ z) \ll x \circ y = \{0\} \), then for all \( a \in (x \circ z) \circ (y \circ z) \), \( a \ll 0 \) and so by (HC\(_3\)) and (HC\(_4\)), \( a = 0 \). Hence \( (x \circ z) \circ (y \circ z) = \{0\} \). Now, it is easy to show that \( x \circ z \ll y \circ z \) .

Theorem 3.6. Let \( H \) be a hyper BCC-algebra. Then \( H \) is a hyper BCK-algebra if and only if \( (x \circ y) \circ z = (x \circ z) \circ y \) holds for all \( x, y, z \in H \).

Proof. Of course, every hyper BCK-algebra satisfies this identity. Conversely, in a hyper BCC-algebra satisfying this identity, for all \( x, y \in H \), we have

\[ x \circ y \ll \{x\} \iff x \circ H \ll \{x\} . \] (3.2)

Proposition 3.5(iv) completes the proof. □

Theorem 3.7. Let \( H \) be a hyper BCC-algebra. Then the set

\[ S(H) = \{ x \in H : x \circ x = \{0\} \} \] (3.3)

is a BCC-algebra.

Proof. Let \( H \) be a hyper BCC-algebra and \( S(H) = \{ x \in H : x \circ x = \{0\} \} \). We claim that for all \( y, z \in S(H) \), \( |y \circ z| = 1 \). Let there exist \( y, z \in S(H) \) such that \( |y \circ z| > 1 \). Hence there exist \( a, b \in y \circ z \) such that \( a \neq b \). Since by (HC\(_1\)) and hypothesis,

\[ a \circ b, b \circ a \subseteq (y \circ z) \circ (y \circ z) \ll y \circ y = \{0\} . \] (3.4)

Then \( a \circ b \ll \{0\} \) and \( b \circ a \ll \{0\} \) and so \( a \ll b \) and \( b \ll a \). Hence by (HC\(_4\)), \( a = b \) which is a contradiction. Therefore, for all \( y, z \in S(H) \), \( y \circ z \) is a singleton set and so \( S(H) \) is a BCC-algebra. □

Theorem 3.8. Let \( H \) be a hyper BCC-algebra such that for all \( x, y \in H \),

\[ x \circ (x \circ y) \ll \{y\} . \] (3.5)

Then, \( H \) is a BCK-algebra.

Proof. By hypothesis and (HC\(_3\)), \( x \circ x = x \circ (x \circ 0) \ll 0 \) for all \( x \in H \) and so \( x \circ x = \{0\} \) for all \( x \in H \). Hence by Theorem 3.7, \( H \) is a BCC-algebra. Now, since by hypothesis, \( x \circ (x \circ y) \ll \{y\} \) or equivalently, \( (x \circ (x \circ y)) \circ y = 0 \) (since \( H \) is a BCC-algebra), then by [4, Corollary 1], \( H \) is a BCK-algebra. □

Generalizing the construction used in [4, 6], we can prove the following.
Theorem 3.9. Let \((H_1, \circ_1)\) be a (proper) hyper BCC-algebra, \(a \notin H_1\), and \(H = H_1 \cup \{a\}\). Define the hyper operation \(\circ\) on \(H\) as follows:

\[
x \circ_1 y = \begin{cases} 
\{a\} & \text{if } x = a, \ y = 0, \\
\{x\} & \text{if } x \in H_1, \ y = a, \\
\{0, a\} & \text{if } x = y = a, \\
\{0\} & \text{if } x = a, \ y \in H_1 - \{0\}, \\
\end{cases}
\]

(3.6)

for all \(x, y \in H\). Then \((H, \circ)\) is a (proper) hyper BCC-algebra.

**Proof.** The proof of \((HC_2), (HC_3),\) and \((HC_4)\) is clear. So, we verify only the axiom \((HC_1)\). Let \(x, y, z \in H\). We consider two cases for \(x\).

**Case 1** ((\(x \in H_1\)). Then \(y \in H_1\) or \(y = a\).

(1a) Let \(y \in H_1\). If \(z \in H_1\), then the proof is clear. If \(z = a\), then

\[
(x \circ z) \circ (y \circ z) = (x \circ z) \circ (y \circ a) = x \circ y = x \circ_1 y \ll x \circ_1 y = x \circ y.
\]

(3.7)

(1b) Let \(y = a\). If \(z = 0\), then

\[
(x \circ y) \circ (y \circ z) = (x \circ 0) \circ (a \circ 0) = (x \circ_1 0) \circ \{a\} = x \circ a = \{x\} \ll \{x\} = x \circ a = x \circ y.
\]

(3.8)

If \(z \in H_1 - \{0\}\), then

\[
(x \circ z) \circ (y \circ z) = (x \circ z) \circ (a \circ z) = (x \circ_1 z) \circ 0 = x \circ_1 z \ll \{x\} = x \circ a = x \circ y.
\]

(3.9)

If \(z = a\), then

\[
(x \circ z) \circ (y \circ z) = (x \circ a) \circ (a \circ a) = a \circ \{0, a\} = \{0, a\} \ll \{a\} = x \circ a = x \circ y.
\]

(3.10)

**Case 2** ((\(x = a\)). Then, as in the previous case, \(y \in H_1\) or \(y = a\).

(2a) Let \(y \in H_1\). If \(z = 0\), then

\[
(x \circ z) \circ (y \circ z) = (a \circ 0) \circ (y \circ 0) = a \circ y \ll a \circ y = x \circ y.
\]

(3.11)

If \(z \in H_1 - \{0\}\), then

\[
(x \circ z) \circ (y \circ z) = (a \circ z) \circ (y \circ z) = 0 \circ (y \circ z) = \{0\} \ll a \circ y = x \circ y.
\]

(3.12)

If \(z = a\), then

\[
(x \circ z) \circ (y \circ z) = (a \circ a) \circ (y \circ a) = \{0, a\} \circ y = \{0\} \cup a \circ y \ll a \circ y = x \circ y.
\]

(3.13)

(2b) Let \(y = a\). If \(z = 0\), then

\[
(x \circ z) \circ (y \circ z) = (a \circ 0) \circ (a \circ 0) = a \circ a = \{0, a\} \ll \{0, a\} = a \circ a = x \circ y.
\]

(3.14)
6 On hyper BCC-algebras

If \( z \in H_1 - \{0\} \), then
\[
(x \circ z) \circ (y \circ z) = (a \circ z) \circ (a \circ z) = 0 \circ 0 = \{0\} \preceq \{0, a\} = a \circ a = x \circ y. \tag{3.15}
\]

If \( z = a \), then
\[
(x \circ z) \circ (y \circ z) = (a \circ a) \circ (a \circ a) = \{0, a\} \preceq \{0, a\} = a \circ a = x \circ z. \tag{3.16}
\]

Hence \( H \) satisfies the axiom of \((HC_1)\). Therefore, \((H, \circ)\) is a hyper BCC-algebra.

\[\square\]

**Corollary 3.10.** For any \( n \geq 3 \), there exists at least one proper hyper BCC-algebra of order \( n \).

**Proof.** The proof follows from Theorem 3.9 and Example 3.2(iii).

**Theorem 3.11.** Let \( \alpha \) be a transfinite cardinal number. Then there exists a hyper BCC-algebra \( H \) such that \( \text{Card}(H) = \alpha \).

**Proof.** Since \( \alpha \) is a transfinite cardinal number, then there exists an infinite set \( A \) such that \( \text{Card}(A) = \alpha \). Now, let \( C = \{x_0, x_1, x_2, x_3, \ldots \} \) be an infinite countable subset of \( A \). Let hyperoperation “\( \diamond \)” on \( C \) be defined as follows:
\[
x_i \diamond x_j = \begin{cases} 
\{x_0, x_i\} & \text{if } i \leq j, \\
\{x_i\} & \text{if } i > j
\end{cases} \tag{3.17}
\]
for all \( x_i, y_j \in C \). Similar to Example 3.2(ii), we can see that \((C, \diamond, x_0)\) is a hyper BCC-algebra. If \( \text{Card}(A) = \text{Card}(C) \), the proof is complete. Now, let \( \text{Card}(C) < \text{Card}(A) \). Let
\[\Omega = \{(H_i, \circ_i, x_0) \mid (H_i, \circ_i, x_0) \text{ is a hyper BCC-algebra, } C \subseteq H_i \subseteq A, \circ_i|_C = \diamond \}. \tag{3.18}\]

Since \((C, \diamond, x_0) \in \Omega \), then \( \Omega \neq \emptyset \). Now, we define the relation “\( \preceq \)” on \( \Omega \) as follows:
\[
(H_i, \circ_i, x_0) \preceq (H_j, \circ_j, x_0) \iff H_i \subseteq H_j, \quad \circ_j|_{H_i} = \circ_i. \tag{3.19}
\]

Then \((\Omega, \preceq)\) is a partially ordered set. Now, let \( \{(H_k, \circ_k, x_0)\}_{k \in I} \) be a totally ordered set in \( \Omega \) and \( H' = \bigcup_{k \in I} H_k \). For all \( x, y \in H' \), there exists \( H_{txy} \in \{(H_k, \circ_k, x_0)\}_{k \in I} \) such that \( x, y \in H_{txy} \) and so we can define hyperoperation “\( \circ' \)” on \( H' \) by \( x \circ' y = x \circ_{txy} y \). It is easy to prove that \((H', \circ, x_0)\) is a hyper BCC-algebra and so \( H' \in \Omega \). Hence by Zoren’s lemma, \( \Omega \) has a maximal element. Let \((H, \circ')\) be a maximal element of \( \Omega \). If \( H = A \), the proof is complete. Let \( H \neq A \). Hence, there exists an element \( a \in A \) such that \( a \notin H \). Now, hyperoperation “\( \circ' \)” on \( H \cup \{a\} \) is defined as follows:
\[
x \circ y = \begin{cases} 
\{a\} & \text{if } x = a, \ y = x_0, \\
\{x\} & \text{if } x \in H, \ y = a, \\
\{x_0, a\} & \text{if } x = y = a, \\
\{x_0\} & \text{if } x = a, \ y \in H - \{x_0\}, \\
x \circ' y & \text{if } x, y \in H
\end{cases} \tag{3.20}
\]
for all \( x, y \in H \). Then by Theorem 3.9, \((H \cup \{a\}, \circ, x_0)\) is a hyper BCC-algebra and so belongs to \( \Omega \), which is a contradiction, because \( H \) is maximal in \( \Omega \). Hence, \( H = A \) and so \( \text{Card}(H) = \alpha \).

\[ \square \]

**Corollary 3.12.** For all transfinite cardinal number \( \alpha \), there are infinite hyper BCC-algebras of order \( \alpha \).

**Proof.** By Theorem 3.11, there exists a hyper BCC-algebra \( H \) such that \( \text{Card}(H) = \alpha \).

Now, let \( A = \{a_1, a_2, a_3, \ldots\} \) be an infinite set such that \( H \cap A = \emptyset \). By Theorem 3.9, \( H_1 = H \cup \{a_1\} \) is a hyper BCC-algebra of order \( \alpha + 1 \). Since \( \alpha \) is a transfinite cardinal number, then \( \alpha + 1 = \alpha \). Hence, \( \text{Card}(H_1) = \alpha \). Similarly, \( H_2 = H_1 \cup \{a_2\} \) is a hyper BCC-algebra of order \( \alpha + 1 = \alpha \). By continuing this process, we get infinite hyper BCC-algebras of order \( \alpha \).

\[ \square \]

4. **Hyper BCC-ideals**

**Definition 4.1.** A subset \( I \) of a hyper BCC-algebra \( H \) such that \( \text{0} \in I \) is called the following:

(i) a **hyper BCC-ideal of type 1**, if

\[ (x \circ y) \circ z \ll I, \quad y \in I \Rightarrow x \circ z \subseteq I, \quad (4.1) \]

(ii) a **hyper BCC-ideal of type 2**, if

\[ (x \circ y) \circ z \subseteq I, \quad y \in I \Rightarrow x \circ z \subseteq I, \quad (4.2) \]

(iii) a **hyper BCC-ideal of type 3**, if

\[ (x \circ y) \circ z \ll I, \quad y \in I \Rightarrow x \circ z \ll I, \quad (4.3) \]

(iv) a **hyper BCC-ideal of type 4**, if

\[ (x \circ y) \circ z \subseteq I, \quad y \in I \Rightarrow x \circ z \ll I. \quad (4.4) \]

**Theorem 4.2.** In any hyper BCC-algebra, the following statements are valid.

(i) Any hyper BCC-ideal of type 1 is a hyper BCC-ideal of types 2 and 3.

(ii) Any hyper BCC-ideal of type 2 is a hyper BCC-ideal of type 4.

(iii) Any hyper BCC-ideal of type 3 is a hyper BCC-ideal of type 4.

(iv) Any hyper BCC-ideal of type 1 is a hyper BCK-ideal.

(v) Any hyper BCC-ideal of type 2 is a weak hyper BCK-ideal.

**Proof.** The statements (i), (ii), and (iii) are clear. So, we prove only (iv) and (v).

(iv) Let \( I \) be a hyper BCC-ideal of type 1, \( x \circ y \ll I \), and \( y \in I \). Hence, by Proposition 3.5(v), we obtain \( (x \circ y) \circ 0 = x \circ y \ll I \). But \( y \in I \), so, applying the hypothesis and \( (HC_3) \), we get \( \{x\} = x \circ 0 \subseteq I \). This shows that \( I \) is a hyper BCK-ideal of \( H \).

(v) The proof of (iv) is analogous.
Example 4.3. (i) In a hyper BCC-algebra $H$ defined in Example 3.2(i), every BCC-ideal $I$ of a BCC-algebra $(H, \ast, 0)$ is a hyper BCC-ideal of types 1, 2, 3, and 4 of a hyper BCC-algebra $(H, \circ, 0)$.

(ii) Let $H = \{0, a, b\}$. Consider Table 4.1.

Then $H$ is a proper hyper BCC-algebra (since $(b \circ a) \circ b \neq (b \circ b) \circ a$). Moreover, $I_1 = \{0, a\}$ is a hyper BCC-ideal of types 1, 2, 3 and 4 while $I_2 = \{0, b\}$ is a hyper BCC-ideal of types 3 and 4 but it is not a hyper BCC-ideal of types 1 and 2 (since $(a \circ b) \circ 0 \subseteq I_2$ and $b \in I_2$ but $a \circ 0 \notin I_2$, then $I_2$ is not a hyper BCC-ideal of type 2 and so by Theorem 4.2(i) it is not a hyper BCC-ideal of type 1).

(iii) Define on $H = \{0, a, b, c\}$ the following three hyperoperations, Tables 4.2, 4.3, and 4.4.

Then, as it is not difficult to verify, $(H, \circ_1)$, $(H, \circ_2)$, and $(H, \circ_3)$ are hyper BCC-algebras. These algebras are proper BCC-algebras because $(c \circ a) \circ b \neq (c \circ b) \circ a$. In $(H, \circ_1)$, $I = \{0, b\}$ is a hyper BCC-ideal of type 4 but it is not a hyper BCC-ideal of type 3 (since
Open problem 4.4. Is there a proper hyper BCC-algebra in which the concepts of a hyper BCC-ideal of type 2 and a weak hyper BCK-ideal are different? We think that in hyper BCC-algebras of orders 3 and 4, these concepts are equivalent(?).

Theorem 4.5. Let $H$ be a hyper BCK-algebra and let $I$ be a nonempty subset of $H$. Then,

(i) $I$ is a hyper BCC-ideal of type 1 if and only if $I$ is a hyper BCK-ideal of $H$,

(ii) $I$ is a hyper BCC-ideal of type 2 if and only if $I$ is a weak hyper BCK-ideal of $H$.

Proof. (i) “If” part. By Theorem 4.2(iv).

“Only if” part. Let $I$ be a hyper BCC-ideal of $H$, $(x \circ y) \circ z \ll I$ and $y \in I$. By (HK$_2$), $(x \circ z) \circ y = (x \circ y) \circ z \ll I$ and so for each $a \in x \circ z$, $a \circ z \ll I$. Since $z \in I$ and $I$ is a hyper BCK-ideal of $H$, then $a \in I$ and so $x \circ y \subseteq I$. Hence $I$ is a hyper BCC-ideal of type 1.

(ii) The proof is similar to the proof of (i). \qed

Now, we summarize Theorems 4.2 and 4.5 in Figure 4.1.

Definition 4.6. A nonempty subset $I$ of a hyper BCC-algebra $H$ satisfies the closed condition if $x \ll y$ and $y \in I$ imply $x \in I$.

Theorem 4.7. A nonempty subset $I$ of a hyper BCC-algebra $H$ satisfying the closed condition is a hyper BCC-ideal of type $i$, for $1 \leq i \leq 4$ if and only if $I$ is a hyper BCC-ideal of type $j$, for $1 \leq j \leq 4$.

Proof. Let $I$ satisfy the closed condition. It is easy to prove that for any subset $A$ of $H$ if $A \ll I$, then $A \subseteq I$. Hence the proof is clear. \qed
Theorem 4.8. Any strong hyper BCK-ideal of a hyper BCC (BCK)-algebra is its hyper subalgebra.

Proof. Let \( I \) be a strong hyper BCK-ideal of \( H \) and \( x, y \in I \). By Proposition 3.5(iv), \( x \circ y \not\in \{ x \} \) and so for each \( a \in x \circ y, a \ll x \) and so \( 0 \in a \circ x \). Since \( 0 \in I \), then \( a \circ x \cap I \neq \emptyset \). Now, since \( x \in I \) and \( I \) is a strong hyper BCK-ideal of \( H \), then \( a \in I \) and so \( x \circ y \subseteq I \). Hence \( I \) is a hyper subalgebra of \( H \).

5. Classification of hyper BCC-algebras of order 3

Based on the results of the previous section, we are able to calculate all nonisomorphic hyper BCC-algebras of order 3. For simplicity, let in this section \( H \) be a hyper BCC-algebra and let \( H = \{ 0, a, b \} \).

We will say that this hyper BCC-algebra is linear if all its elements are comparable, that is, if \( 0 \ll a \ll b \) or \( 0 \ll b \ll a \). Any other hyper BCC-algebra \( H \) will be called nonlinear. Of course, in any case, we have \( 0 \ll a \) and \( 0 \ll b \).

Theorem 5.1. There are only three nonisomorphic nonlinear hyper BCC-algebras of order 3, which are not proper hyper BCC-algebras.

Proof. In a nonlinear hyper BCC-algebra \( H \), we have the following:

1. \( x \not\in y \circ x \) for all \( x, y \in H \) such that \( x \neq y \),
2. \( a \circ b = \{ a \} \) and \( b \circ a = \{ b \} \),
3. \( a \circ a = \{ 0 \} \) or \( \{ 0, a \} \) and \( b \circ b = \{ 0 \} \) or \( \{ 0, b \} \).

Indeed, if \( x \neq y \) and \( x \in y \circ x \), then \( x \neq 0 \), because \( x = 0 \) implies \( y \neq 0 \) and \( 0 \in y \circ 0 = \{ y \} \), whence \( y = 0 \), which is impossible. By Proposition 3.5(iv), \( y \circ x \subseteq \{ y \} \). Therefore, \( x \ll y \). But \( x \neq 0 \), so, \( a \ll b \) or \( b \ll a \), which is impossible by the assumption. This proves (1).

2. From \( a \not\ll b \), it follows that \( 0 \not\in a \circ b \). So, \( a \circ b \) cannot be equal to \( \{ 0 \}, \{ 0, a \}, \{ 0, b \}, \) or \( \{ 0, a, b \} \). Because by (1), we have also \( b \not\in a \circ b \), then \( a \circ b \) cannot be equal to \( \{ b \} \) or \( \{ a, b \} \). Thus \( a \circ b = \{ a \} \). Similarly, we can prove that \( b \circ a = \{ b \} \).

3. For \( a \circ a \), the following cases are possible: \( \{ 0 \}, \{ 0, a \}, \{ 0, b \}, \) or \( \{ 0, a, b \} \). In the case \( a \circ a = \{ 0, b \} \) or \( a \circ a = \{ 0, a, b \} \), by Proposition 3.5(iv), we get \( a \circ a \ll a \). But by the assumption, \( b \in a \circ a \), whence \( b \ll a \), which is impossible. So, \( a \circ a \not\in \{ 0, a, b \} \) and \( a \circ a \not\in \{ 0, b \} \). This means that \( a \circ b = \{ 0 \} \) or \( a \circ b = \{ 0, a \} \). Similarly, we can show that \( b \circ b = \{ 0 \} \) or \( b \circ b = \{ 0 \}, \{ 0, b \} \).

Therefore, by (1), (2), and (3), we conclude that there are four nonlinear hyper BCC-algebras containing three elements. Their hyperoperations are given by Tables 5.1, 5.2, 5.3, and 5.4.

But \( (H, \circ_2) \) and \( (H, \circ) \) are isomorphic. The isomorphism \( f : (H, \circ) \rightarrow (H, \circ_2) \) is defined by \( f(0) = 0, f(a) = b \) and \( f(b) = a \). Other nonlinear hyper BCC-algebras are not isomorphic. It is clear that they are not proper hyper BCC-algebras.

Theorem 5.2. There are no linear hyper BCC-algebras of order 3 containing two proper hyper BCK-ideals.

Proof. Suppose that there is a linear hyper BCC-algebra \( H \) of order 3 that has two proper hyper BCK-ideals. Then \( I_1 = \{ 0, a \} \) and \( I_2 = \{ 0, b \} \) must be proper hyper BCK-ideals. Let

a \ll b. Then a ⊙ b is equal to \{0\}, \{0,a\}, \{0,b\}, or \{0,a,b\}. In all these cases, a ⊙ b \ll I₂. Since I₂ is a hyper BCK-ideal of H and b ∈ I₂, so, a ∈ I₂, which is impossible. For b \ll a, we obtain a similar contradiction.

Theorem 5.3. There are 12 nonisomorphic linear hyper BCC-algebras of order 3 containing only one proper hyper BCK-ideal and this ideal is strong too. Only two such hyper BCC-algebras are proper.

Proof. Without loss of generality, let I₁ = \{0,a\} be the proper strong hyper BCK-ideal of a linear hyper BCC-algebra H. Then a \ll b or b \ll a. For b \ll a, we have 0 ∈ b ⊙ a, which gives b ⊙ a ∩ I₁ ≠ ∅. But I₁ is a strong hyper BCK ideal, so, a ∈ I₁ implies b ∈ I₁, which is impossible. Hence, a \ll b and b \ll a. Thus b ⊙ a is equal to \{a\}, \{b\}, or to \{a,b\}. If b ⊙ a = \{a\}, then b ⊙ a \ll I₁, whence b ∈ I₁, which is not true. Therefore, b ⊙ a ≠ \{a\}. In the case b ⊙ a = \{a,b\}, we have b ⊙ a ∩ I₁ ≠ ∅, consequently, b ∈ I₁, because I₁ is strong. This also is impossible. Thus it must be b ⊙ a = \{b\}. Moreover, a \ll b implies 0 ∈ a ⊙ b. Thus a ⊙ b is equal to one of the sets \{0\}, \{0,a\}, \{0,b\}, \{0,a,b\}. If a ⊙ b = \{0,b\}, then, by Proposition 3.5(iv), \{0,b\} = a ⊙ b \ll a, whence b \ll a which is not true. For a ⊙ b =

</table>

{0,a,b}, we obtain the similar contradiction. Thus $a \circ b = \{0\}$ or $\{0,a\}$. To compute $a \circ a$, observe that $a \circ a$ can be equal to one of the sets $\{0\}, \{0,a\}, \{0,b\}$, or $\{0,a,b\}$. If $a \circ a = \{0,b\}$ or $\{0,a,b\}$, then $a \circ a \ll a$ implies $b \ll a$, which is impossible. So, $a \circ a = \{0\}$ or $\{0,a\}$. Furthermore, $b \circ b$ is equal to $\{0\}, \{0,a\}, \{0,b\}$, or $\{0,a,b\}$. This means that totally we have $2 \times 2 \times 4 = 16$ different cases for $H$.

Consider Tables 5.5, 5.6, 5.7, and 5.8.

In $(H, \circ_i), 1 \leq i \leq 4$, we have $(a \circ b) \circ (a \circ b) \not\ll a \circ a$. Thus $(H, \circ_i)$ are not hyper BCC-algebras.

The other 12 cases are presented in Tables 5.9, 5.10, 5.11, 5.12, 5.13, 5.14, 5.15, 5.16, 5.17, 5.18, 5.19, and 5.20.

It is not difficult to verify that hyperstructures defined by these tables are hyper BCC-algebras. Because the nonidentity homomorphism $f$ from $(H, \circ_i)$ onto $(H, \circ_j)$, $i \neq j$, and $4 \leq i, j \leq 15$, is defined by $f(0) = 0$, $f(a) = b$, $f(b) = a$, then these 12 hyper BCC-algebras are not isomorphic. Only hyper BCC-algebras $(H, \circ_4)$ and $(H, \circ_5)$ are proper. In these hyper BCC-algebras, we have $(b \circ a) \circ b \neq (b \circ b) \circ a$. □

Theorem 5.4. There are four nonisomorphic linear hyper BCK-algebras of order 3 containing only one proper hyper BCK-ideal and this ideal is not strong. One of them is a proper BCC-algebra.

Proof. Without loss of generality, let $I_1 = \{0, a\}$ be the proper hyper BCK-ideal of $H$ which is not strong. Since $H$ is linear, then $b \preccurlyeq a$ or $a \preccurlyeq b$. If $b \preccurlyeq a$, then $0 \in b \circ a$ and so $b \circ a = \{0\}$ or $\{0, a\}$. Since $b \preccurlyeq a$, then in any of the above cases, $b \circ a \preccurlyeq I_1$. Now, since $a \in I_1$ and $I_1$ is a hyper BCK-ideal of $H$, then $b \in I_1$ which is impossible. Hence $a \preccurlyeq b$ and so $0 \notin b \circ a$. Therefore, $b \circ a$ is equal to $\{a\}$, $\{b\}$, or $\{a, b\}$. If $b \circ a = \{a\}$, then $b \circ a \preccurlyeq I_1 = \{0, a\}$. Since $a \in I_1$ and $I_1$ is a hyper BCK-ideal, we get $b \in I_1$, which is not true. In the case $b \circ a = \{b\}$, $I_1$ is a strong hyper BCK-ideal, because $b \circ a \cap I_1 = b \circ 0 \cap I_1 = \emptyset$. This is a contradiction. Thus it must be $b \circ a = \{a, b\}$.

</table>
Next, similarly as in the proof of Theorem 5.3, we can show that $a \circ a$ is equal to $\{0\}$ or $\{0,a\}$, $a \circ b$ is equal to $\{0\}$ or $\{0,a\}$, and $b \circ b$ is equal to $\{0\}$, $\{0,a\}$, $\{0,b\}$, or $\{0,a,b\}$. Thus there are $2 \times 2 \times 4 = 16$ different cases for $H$.

(i) Let $a \circ a = \{0\}$. If $a \circ b = \{0\}$, $b \circ b = \{0\}$, or $b \circ b = \{0,a\}$, then

$$
(b \circ a) \circ (b \circ a) \not\ll b \circ b. \tag{5.1}
$$

If $a \circ b = \{0,a\}$, then we have

$$
(a \circ b) \circ (a \circ b) \not\ll a \circ a. \tag{5.2}
$$

This means that in these six cases, obtained hyperstructures are not hyper BCC-algebras.

(ii) Let $a \circ a = \{0,a\}$. If $a \circ b = \{0\}$, then

$$
(a \circ a) \circ (b \circ a) \not\ll a \circ b. \tag{5.3}
$$

If $a \circ b = \{a\}$ and $b \circ b = \{0\}$, or $b \circ b = \{0,a\}$, then

$$
(b \circ a) \circ (b \circ a) \not\ll b \circ b. \tag{5.4}
$$

So, in these cases, we do not obtain a hyper BCC-algebra too. In the remaining four cases, we obtain hyperstructures in Tables 5.21, 5.22, 5.23, and 5.24.

Direct computations show that these four hyperstructures are hyper BCC-algebras. It is clear that these hyper BCC-algebras are not isomorphic. Only the last hyperstructure is not a hyper BCK-algebra. Indeed, in $\langle H, \circ_{19} \rangle$, we have $(b \circ a) \circ b \neq (b \circ b) \circ a$. \hfill \Box
Theorem 5.5. There are three nonisomorphic and nonproper linear hyper BCC-algebras of order 3 without proper hyper BCK-ideals.

Proof. Without loss of generality, we let \( a \prec b \). Then \( 0 \in a \circ b \) and so \( a \circ b \) is equal to one of the sets \( \{0\}, \{0,a\}, \{0,b\} \), or \( \{0,a,b\} \). If \( a \circ b = \{0,b\} \), then by Proposition 2.3, \( \{0,b\} = a \circ b \not\prec \{a\} \), thus \( b \not\prec a \) which is not true. If \( a \circ b = \{0,a,b\} \), then similarly, we obtain a contradiction \( b \not\prec a \). Thus \( a \circ b = \{0\} \) or \( \{0,a\} \). Clearly, \( a \circ a \) can be equal to one of the sets \( \{0\}, \{0,a\}, \{0,b\} \), or \( \{0,a,b\} \). If \( a \circ a = \{0,b\} \) or \( \{0,a,b\} \), then since \( a \circ a \not\prec a \), we get that \( b \not\prec a \) which is impossible. Thus \( a \circ a = \{0\} \) or \( \{0,a\} \). Also \( b \circ b \) is equal to one of the sets \( \{0\}, \{0,a\}, \{0,b\} \), or \( \{0,a,b\} \). Furthermore, \( b \circ a \) is equal to one of the sets \( \{a\}, \{b\}, \{a,b\} \). If \( b \circ a = \{b\} \), then similar to the proof of Theorem 5.4, we conclude that \( I_1 \) is strong, which is a contradiction. If \( b \circ a = \{a,b\} \), then all of hyper BCK-algebras which are obtained are the same as Theorem 5.4. But each of these kinds of hyper BCK-algebras has a proper BCK-ideal \( I_1 = \{0,a\} \), while by hypothesis, the involved hyper BCK-algebras have not a proper BCK-ideal. So \( b \circ a \neq \{a,b\} \) and we must have \( b \circ a = \{a\} \). Thus we have \( 2 \times 2 \times 4 = 16 \) different possibilities.

(i) Let \( a \circ a = \{0\} \). If \( a \circ b = \{0\} \) and \( b \circ b = \{0,b\} \), or \( b \circ b = \{0,a,b\} \), then

\[
(b \circ b) \circ (a \circ b) \not\prec b \circ a.
\]

(5.5)

If \( a \circ b = \{0,a\} \), then

\[
(a \circ b) \circ (a \circ b) \not\prec a \circ a.
\]

(5.6)

Therefore, in the above six cases, we do not obtain a hyper BCC-algebra.

(ii) Let \( a \circ a = \{0,a\} \). If \( a \circ b = \{0\} \), then

\[
(a \circ a) \circ (b \circ a) \not\prec a \circ b.
\]

(5.7)

If \( a \circ b = \{0,a\} \) and \( b \circ b \) is one of the sets \( \{0,b\} \) or \( \{0,a,b\} \), then

\[
(b \circ b) \circ (a \circ b) \not\prec b \circ a.
\]

If \( a \circ b = \{0,a\} \) and \( b \circ b = \{0\} \), then

\[
(b \circ a) \circ (b \circ a) \not\leq b \circ b.
\]

(5.9)

Hence, in the above seven cases, we do not obtain a hyper BCC-algebra too. In the remaining three cases, we obtain the following hyperstructures in Tables 5.25, 5.26, and 5.27.

It is not difficult to check that these hyperstructures are hyper BCC-algebras which are not proper hyper BCC-algebras. Obviously, these hyper BCC-algebras are not isomorphic.

Summarizing our calculations, we obtain the following corollaries.

**Corollary 5.6.** There are 22 nonisomorphic hyper BCC-algebras of order 3.

**Corollary 5.7.** There are only three proper nonisomorphic hyper BCC-algebras of order 3 in Tables 5.28, 5.29, and 5.30.
Table 5.29

\[
\begin{array}{c|ccc}
\circ \delta & 0 & a & b \\
\hline
0 & \{0\} & \{0\} & \{0\} \\
a & \{a\} & \{0\} & \{0\} \\
b & \{b\} & \{b\} & \{0, a, b\} \\
\end{array}
\]

Table 5.30

\[
\begin{array}{c|ccc}
\circ \eta & 0 & a & b \\
\hline
0 & \{0\} & \{0\} & \{0\} \\
a & \{a\} & \{0\} & \{0\} \\
b & \{b\} & \{a, b\} & \{0, b\} \\
\end{array}
\]

Acknowledgments

Authors would like to express their sincere thanks to the referees for their valuable suggestions and comments.

Special Issue on
Time-Dependent Billiards

Call for Papers

This subject has been extensively studied in the past years for one-, two-, and three-dimensional space. Additionally, such dynamical systems can exhibit a very important and still unexplained phenomenon, called as the Fermi acceleration phenomenon. Basically, the phenomenon of Fermi acceleration (FA) is a process in which a classical particle can acquire unbounded energy from collisions with a heavy moving wall. This phenomenon was originally proposed by Enrico Fermi in 1949 as a possible explanation of the origin of the large energies of the cosmic particles. His original model was then modified and considered under different approaches and using many versions. Moreover, applications of FA have been of a large broad interest in many different fields of science including plasma physics, astrophysics, atomic physics, optics, and time-dependent billiard problems and they are useful for controlling chaos in Engineering and dynamical systems exhibiting chaos (both conservative and dissipative chaos).

We intend to publish in this special issue papers reporting research on time-dependent billiards. The topic includes both conservative and dissipative dynamics. Papers discussing dynamical properties, statistical and mathematical results, stability investigation of the phase space structure, the phenomenon of Fermi acceleration, conditions for having suppression of Fermi acceleration, and computational and numerical methods for exploring these structures and applications are welcome.

To be acceptable for publication in the special issue of Mathematical Problems in Engineering, papers must make significant, original, and correct contributions to one or more of the topics above mentioned. Mathematical papers regarding the topics above are also welcome.

Authors should follow the Mathematical Problems in Engineering manuscript format described at http://www.hindawi.com/journals/mpe/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:

<table>
