REGULARIZATION AND ASYMPTOTIC EXPANSION
OF CERTAIN DISTRIBUTIONS
DEFINED BY DIVERGENT SERIES

San José, Costa Rica

(Received May 4, 1994 and in revised form September 6, 1994)

ABSTRACT. The regularization of the distribution \( \sum_{n=-\infty}^{\infty} \delta(x - p^n) \), which gives a regularized value to the divergent series \( \sum_{n=-\infty}^{\infty} \phi(p^n) \), is obtained in several spaces of test functions. The asymptotic expansion as \( \varepsilon \to 0^+ \) of series of the type \( \sum_{n=0}^{\infty} \phi(xp^n) \) is also obtained.

KEY WORDS AND PHRASES Generalized functions, asymptotic expansions

1992 AMS SUBJECT CLASSIFICATION CODES. 41A60, 46F12

1. INTRODUCTION.

Divergent series of the type
\[
\sum_{n=-\infty}^{\infty} \phi(p^n), \quad \sum_{n=0}^{\infty} \phi(p^n).
\]
where \( p > 1 \) and where \( \phi \) is a given function, as well as the asymptotic development as \( \varepsilon \to 0^+ \) of the related series
\[
\sum_{n=-\infty}^{\infty} \phi(xp^n), \quad \sum_{n=0}^{\infty} \phi(xp^n).
\]
have been shown to be of importance in several areas, among which we could mention the counting algorithms used in database systems [8] and the use by Ramanujan of related series, with \( p = 2 \), in his approach to the problem of the distribution of prime numbers [10, lecture 2].

The aim of the present article is to provide a regularization of the generalized function
\[
g(x) = \sum_{n=-\infty}^{\infty} \delta(x - p^n),
\]
where \( \delta(x - \xi) \) is the Dirac delta function concentrated at the point \( \xi \), so that the evaluation of \( g(x) \) at the test function \( \phi(x) \), \( \langle g, \phi \rangle \), provides a regularized value to the generally divergent series
\[
\sum_{n=-\infty}^{\infty} \phi(p^n).
\]
We give regularizations in the standard spaces of distributions \( \mathcal{D} \) or \( \mathcal{S} \) as well as in the spaces \( \mathcal{S}\{x^{\alpha}\} \) and \( \mathcal{S}\{x^{\alpha} \ln x\cdot x^{\alpha}\} \) introduced in [6] to study distributional asymptotic expansions. The regularization is achieved by using the Hadamard finite part ideas, employed in the regularization of distributions defined by divergent integrals [5].
Subsequently, we consider the asymptotic developments (1.2) by using the theory of asymptotic expansions of generalized functions. The close ties between generalized functions and asymptotic analysis have been studied by several authors [1,3,4,6,7,12,14,15], who have shown that generalized functions provide a very suitable framework for the asymptotic expansion of integrals and series.

In the present study we obtain the expansion of (1.2) as \( \varepsilon \to 0^+ \) for smooth functions with power or logarithmic behavior near the origin.

The plan of the article is as follows. In the second section we briefly review some ideas from the theory of asymptotic expansions of distributions. The third section studies related expansions of convergent series. The regularization in \( S'(x^n) \) and in \( S'(x^\alpha \ln x, x^{\alpha-1}) \) is considered in the next two sections, respectively, where the asymptotic expansion is also given. The last section gives an illustration of these results to the construction of counterexamples to some Hardy Littlewood type Tauberian theorems.

2. PRELIMINARIES.

In this section we provide a list of spaces of generalized functions needed in this paper. We also discuss the moment asymptotic expansion, a concept that plays a key role in our analysis.

The basic spaces of distributions that we are going to need are the spaces \( \mathcal{D}'(\mathbb{R}) \), \( \mathcal{S}'(\mathbb{R}) \) and \( \mathcal{E}'(\mathbb{R}) \). The space of test functions \( \mathcal{D} \) consists of the smooth functions with compact support. The space of test functions \( \mathcal{S} \) consist of those smooth functions \( \phi \) for which

\[
\phi^{(j)}(x) = O(|x|^{-n}), \quad \text{as } |x| \to \infty. \tag{2.1}
\]

for each \( j, n \geq 0 \). The space \( \mathcal{E} \) consists of all smooth functions with the topology of uniform convergence of all derivatives on compact sets. The dual spaces, \( \mathcal{D}' \), \( \mathcal{S}' \), and \( \mathcal{E}' \) are, respectively, the spaces of standard, tempered and compactly supported distributions. For details, see [11,13].

The moment asymptotic expansion in the space \( \mathcal{E} \) takes the following form

**THEOREM 1.** Let \( f \in \mathcal{E}' \). Then

\[
f(\lambda x) \sim \sum_{n=0}^{\infty} \frac{(-1)^n \mu_n \delta^{(n)}(x)}{n! \lambda^{n+1}}, \quad \text{as } \lambda \to \infty, \tag{2.2}
\]

where

\[
\mu_n = \langle f(x), x^n \rangle \tag{2.3}
\]

are the moments.

The moment asymptotic expansion also hold in other spaces such as \( \mathcal{C}' \), \( \mathcal{C}'_M \), \( k' \) or \( \mathcal{P}' \) of distributions of "rapid decay at infinity", but it does not hold in \( \mathcal{S}' \) nor \( \mathcal{D}' \) [6,7]. At present we shall have use for the result in \( \mathcal{E}' \) only.

Another class of spaces of generalized functions, very suitable for the study of asymptotic expansions, is the following. Let \( \{ \phi_n(x) \} \) be a sequence of smooth functions defined in \( (0, \infty) \).
such that for each $k = 0, 1, 2, \ldots$ the sequence $\{\phi_{n}^{(k)}(x)\}$ is an asymptotic sequence as $x \to 0^+$. If $A$ is any space of test functions, such as $E$, $D$, $S$ or other, then the space $A\{\phi_n(x)\}$ consists of those smooth functions $\psi(x)$ defined in $(0, \infty)$ which show the behavior of the type of the space $A$ as $x \to \infty$ while for small $x$ admit the asymptotic expansion for $k = 0, 1, 2, \ldots$

$$c^{(k)}(x) \sim a_1\phi_1^{(k)}(x) + a_2\phi_2^{(k)}(x) + a_3\phi_3^{(k)}(x) + \cdots \quad \text{as} \quad x \to 0^+. \quad (2.4)$$

where $a_1, a_2, a_3, \ldots$ are certain constants.

The functionals $\delta_n \in A\{\phi_n\}$ are given as

$$\langle \delta_n(x), \psi(x) \rangle = a_n. \quad (2.5)$$

The generalized moment asymptotic expansion in the space $E\{x^{\alpha} \}$, where $\{\alpha_n\}$ is a sequence with $\Re \alpha_n \not\to \infty$, takes the form

$$f(\lambda x) \sim \sum_{n=1}^{\infty} \frac{\mu(\alpha_n)\delta_n(x)}{\lambda^{\alpha_n+1}}. \quad \text{as} \quad \lambda \to \infty. \quad (2.6)$$

where $f \in E\{x^{\alpha} \}$ and where $\mu(\alpha_n) = \langle f(x), x^{\alpha} \rangle$ are the moments.

A moment expansion also holds in the space $E\{x^{\alpha} \ln x, x^{\alpha} \}$. If we use the notation $\delta_n(x)$ and $\delta'_n(x)$ for the functionals defined as

$$\langle \delta_n(x), \psi(x) \rangle = a_n. \quad (2.7a)$$

$$\langle \delta'_n(x), \psi(x) \rangle = a'_n. \quad (2.7b)$$

for a function $\psi \in E\{x^{\alpha} \ln x, x^{\alpha} \}$ with expansion

$$\psi(x) \sim \sum_{n=1}^{\infty} (a'_n \ln x + a_n) x^{\alpha_n}. \quad \text{as} \quad x \to 0^+. \quad (2.8)$$

then the moment asymptotic expansion takes the form

$$f(\lambda x) \sim \sum_{n=1}^{\infty} -\mu'(\alpha_n)\delta'_n(x) \ln \lambda + \frac{\mu'(\alpha_n)\delta'_n(x) + \mu(\alpha_n)\delta_n(x)}{\lambda^{\alpha_n+1}}. \quad (2.9)$$

as $\lambda \to \infty$ where the $\mu'(\alpha_n) = \langle f(x), x^{\alpha} \ln x \rangle$ are the logarithmic moments.

3. EXPANSION IN THE SPACE $S$.

In this section we consider the asymptotic expansion as $\varepsilon \to 0^+$ of series of the type

$$\sum_{n=0}^{\infty} p^n \phi(\varepsilon p^n). \quad (3.1)$$

when the function $\phi$ belongs to the space $S$. Here $p$ is a constant, $p > 1$.

Notice that the values of $\phi(x)$ for negative $x$ are irrelevant. What matters is that $\phi$ is smooth near $x = 0$ and thus the one-sided Taylor expansion
\( \phi(x) \sim \phi(0) + x \phi'(x) + \frac{x^2}{2!} \phi''(x) + \cdots \) as \( x \to 0^+ \). \hfill (3.2)

holds.

In order to study (3.1) we introduce the three generalized functions \( f(x) \), \( f_+(x) \) and \( f_-(x) \) defined as follows:

\[
    f(x) = \sum_{n=-\infty}^{\infty} \rho^n \delta(x - p^n).
\]  

\( f_+(x) = \sum_{n=0}^{\infty} \rho^n \delta(x - p^n). \hfill (3.3a) \)

\( f_-(x) = \sum_{n=1}^{\infty} \rho^{-n} \delta(x - p^{-n}). \) \hfill (3.3c)

Observe that \( f, f_+ \) and \( f_- \) are positive Radon measures and that

\[
    f(x) = f_+(x) + f_-(x). \hfill (3.4)
\]

Notice also that (3.1) can be written as

\[
    \sum_{n=0}^{\infty} \rho^n \phi(\varepsilon p^n) = \varepsilon^{-1} (f_+(x), \phi(\varepsilon x)) = (f_+(\lambda x), \phi(x)). \hfill (3.5)
\]

where \( \lambda = \varepsilon^{-1} \).

Let us start with the distribution \( f(x) \). Clearly, \( f \in S' \). Moreover,

\[
    f(\rho x) = f(x). \hfill (3.6)
\]

as follows directly from (3.3a). Thus

\[
    f(x) = F(\ln x). \hfill (3.7)
\]

where \( F \) is periodic of period \( \ln p \). The mean of \( F \) its average over an interval of length \( \ln p \) is

\[
    \frac{1}{\ln p} \int_{-\infty}^{+\infty} F(t) \, dt = \frac{1}{\ln p} \int_{-\infty}^{+\infty} f(x) \, \frac{dx}{x} = \frac{1}{\ln p}. \hfill (3.8)
\]

Therefore we can write

\[
    f(x) = \frac{H(x)}{\ln p} + g(x). \hfill (3.9)
\]

where \( H(x) \) is the Heaviside function and where \( g \) is a periodic function of \( \ln x \) of period \( \ln p \) and zero mean. It follows that if \( \phi \in \mathcal{S} \) then

\[
    \sum_{n=-\infty}^{\infty} \rho^n \phi(\varepsilon p^n) = \frac{1}{\varepsilon \ln p} \int_{0}^{\infty} \phi(x) \, dx + \frac{\psi(\varepsilon)}{\varepsilon}. \hfill (3.10)
\]

where the oscillatory component \( \psi(\varepsilon) = \psi(\phi; \varepsilon) \), given by

\[
    \psi(\varepsilon) = \varepsilon (g(x), \phi(\varepsilon x)). \hfill (3.11)
\]

is a periodic function of \( \ln \varepsilon \) of period \( \ln p \) and zero mean.
Next, let us consider the generalized function \( f_-(x) \). It has compact support and thus \( f_-(\lambda x) \) admits the moment asymptotic expansion as \( \lambda \to \infty \).

The moments are

\[
\mu_k = \langle f_-(x), x^k \rangle = \sum_{n=1}^{\infty} p^{-n} p^{-nk} = \frac{1}{p^{k+1} - 1},
\]

hence

\[
f_-(\lambda x) \sim \sum_{k=0}^{\infty} \frac{(-1)^k \lambda^k(x)}{k!(p^{k+1} - 1)\lambda^{k+1}}, \quad \text{as } \lambda \to \infty.
\]

Combining (3.4), (3.9) and (3.13) we obtain the development of \( f_+(\lambda x) \) as

\[
f_+(\lambda x) \sim \frac{H(x)}{\ln p} + g(\lambda x) + \sum_{k=0}^{\infty} \frac{(-1)^k \lambda^k(x)}{k!(p^{k+1} - 1)\lambda^{k+1}}, \quad \text{as } \lambda \to \infty.
\]

Evaluating (3.14) at \( \phi \in \mathcal{S} \) and setting \( \lambda = \varepsilon^{-1} \) yields the expansion

\[
\sum_{n=0}^{\infty} \phi(\varepsilon p^n) \sim \frac{1}{\varepsilon \ln p} \int_0^{\infty} \phi(x) \, dx + \frac{\psi(\varepsilon)}{\varepsilon} \sum_{k=0}^{\infty} \frac{\phi^{(k)}(0)\varepsilon^k}{k!(p^{k+1} - 1)}.
\]

4. REGULARIZATION IN THE SPACE \( \mathcal{S}'\{x^{\alpha_n}\} \).

Notice that (3.15) does not give the asymptotic development of the series \( \sum_{n=0}^{\infty} \phi(\varepsilon p^n) \), for \( \phi \in \mathcal{S} \), unless \( \phi(0) = 0 \). We now attend to this problem, in the more general framework of the spaces \( \mathcal{S}\{x^{\alpha_n}\} \). Indeed, the development of \( \sum_{n=0}^{\infty} p^n \phi(\varepsilon p^n) \) for \( \psi \in \mathcal{S}\{x^{-1}, 1, r, \ldots\} \) would give the expansion of \( \sum_{n=0}^{\infty} \phi(\varepsilon p^n) \) for \( \phi \in \mathcal{S} \) by setting \( \psi(x) = x^{-1} \phi(x) \).

Even though the series \( \sum_{n=0}^{\infty} p^n \phi(\varepsilon p^n) \) converges for \( \phi \in \mathcal{S}\{x^{\alpha_n}\} \) for any sequence \( \{\alpha_n\} \) with \( \Re \alpha_n / \alpha \to \infty \), the method of the previous section requires the consideration of the two generally divergent series

\[
\langle f(x), \phi(x) \rangle = \sum_{n=-\infty}^{\infty} p^n \phi(p^n), \quad (4.1a)
\]

\[
\langle f_-(x), \phi(x) \rangle = \sum_{n=1}^{\infty} p^n \phi(p^{-n}). \quad (4.1b)
\]

Therefore, we study the regularization of \( f(x) \) and \( f_-(x) \) in the spaces \( \mathcal{S}\{x^{\alpha_n}\} \). Naturally the two regularization problems are equivalent in view of (3.5).

Let \( \phi \in \mathcal{S}\{x^{\alpha_n}\} \), with expansion

\[
\phi(x) \sim a_1 x^{\alpha_1} + a_2 x^{\alpha_2} + a_3 x^{\alpha_3} + \cdots, \quad \text{as } x \to 0^+.
\]

Suppose \( \alpha_m = -1 \). Then the series giving the value of \( \langle f_-(x), \phi(x) \rangle - \sum_{j=1}^{m} a_j x^{\alpha_j} \) converges. Thus it is enough to give the finite part of the sum \( \sum_{n=1}^{\infty} p^{-n} \phi(p^{-n}) \) if \( \phi(x) = x^{\alpha}, \alpha \leq -1 \). If \( \alpha < -1 \) we have

\[
\phi(x) \sim a_1 x^{\alpha_1} + a_2 x^{\alpha_2} + a_3 x^{\alpha_3} + \cdots, \quad \text{as } x \to 0^+.
\]
\[
\sum_{n=1}^{N} p^{-n}p^{-\alpha n} = \frac{p^{-(1+\alpha)} - p^{-N(1+\alpha)}}{1 - p^{-1+\alpha}}.
\]

thus the partial sums consist of two parts, namely, the infinite part \(\frac{p^{-N(1+\alpha)}}{1 - p^{-1+\alpha}}\), and the finite part

\[
(f_-(x), x^n) = \text{Fp} \sum_{n=1}^{\infty} p^{-n(1+\alpha)} = \frac{1}{p^{1+\alpha} - 1}.
\]  \(\text{(4.3)}\)

When \(\alpha = -1\), we have

\[
(f_-(x), x^{-1}) = \text{Fp} \sum_{n=1}^{\infty} 1 = \text{Fp} \lim_{N \to \infty} N = 0.
\]  \(\text{(4.4)}\)

Therefore, the regularization of \(f_-(x)\) is given by

\[
\langle f_-(x), \phi(x) \rangle = \sum_{j=1}^{m-1} \frac{a_j}{p^{1+\alpha_j} - 1} + \sum_{n=1}^{\infty} p^{-n}\left(\phi(p^{-n}) - \sum_{j=1}^{m} a_j p^{-(n+1)\alpha_j}\right).
\]  \(\text{(4.5)}\)

if \(\phi \in S\{x^{\alpha_n}\}\) has the expansion (4.2).

The regularization of \(f(x)\) is given by the formula \(f = f_+ + f_-\), since \(f_+\) is a well-defined element of \(S\{x^{\alpha_n}\}\). Observe that if \(\phi \in S\{x^{\alpha_n}\}\) has the development (4.2) then

\[
\langle f(px), \phi(x) \rangle = \frac{1}{p} \langle f(x), \phi(x/p) \rangle
\]

so that \(f(x)\) is still a periodic function of \(\ln x\) in the space \(S\{x^{\alpha_n}\}\). Hence we can write, as before,

\[
f(x) = \frac{H(x)}{\ln p} + g(x).
\]  \(\text{(4.6)}\)

where the oscillatory generalized function \(g(x)\) has zero mean.

Notice, however, that the formula \(H(\lambda x) = H(x)\) ceases to hold in the space \(S\{x^{\alpha_n}\}\).

Indeed, if \(\phi \in S\{x^{\alpha_n}\}\), the integral \(\int_0^\infty \phi(x) dx\) is generally divergent and thus it is necessary to consider its finite part \(\text{Fp} \int_0^\infty \phi(x) dx\). But if \(\alpha_m = -1\), then

\[
\text{Fp} \int_0^\infty \phi(\varepsilon x) dx = \frac{1}{\varepsilon} \left[ \text{Fp} \int_0^\infty \phi(x) dx - a_m \ln \varepsilon \right].
\]  \(\text{(4.7)}\)

so that

\[
H(\lambda x) = H(x) + \frac{\ln \lambda}{\lambda} \delta_m(x).
\]  \(\text{(4.8)}\)

where \(\delta_m(x)\) is the functional defined in (2.5), so that \(\langle \delta_m, \phi \rangle = a_m\).

The moment asymptotic expansion of \(f_-(\lambda x)\) in the space \(S\{x^{\alpha_n}\}\) takes the form

\[
f_-(\lambda x) \sim \sum_{j=1}^{m-1} \frac{\delta_j(x)}{(p^{1+\alpha_j} - 1)\lambda^{\alpha_j}} + \sum_{j=m+1}^{\infty} \frac{\delta_j(x)}{(p^{1+\alpha_j} - 1)\lambda^{\alpha_j}}, \quad \text{as } \lambda \to \infty.
\]  \(\text{(4.9)}\)
If we now use (4.6), (4.8) and (4.9), we obtain the expansion of \( f_+(\lambda x) \) as

\[
f_+(\lambda x) \sim -\sum_{j=1}^{m-1} \frac{\lambda_j(x)}{(p^{j+\alpha_j} - 1)^{\lambda_j}} + \frac{\ln \lambda}{\ln p} \beta_m(x) + \frac{1}{\lambda} \left[ \frac{H(x)}{\ln p} + g(\lambda x) \right] - \sum_{j=m+1}^{\infty} \frac{\lambda_j(x)}{(p^{j+\alpha_j} - 1)^{\lambda_j}}.
\]  

(4.10)

Set \( \varepsilon = \lambda^{-1} \). Then evaluation at \( \phi \in S'\{x^{\alpha} \} \) yields

\[
\sum_{n=0}^{\infty} \mu^{\varepsilon \phi}(x^{p^n}) \sim \sum_{j=1}^{m-1} \frac{a_j e^{\alpha_j}}{1 - p^{j+\alpha_j}} - \frac{a_m \ln \varepsilon}{\ln p} + \frac{1}{\varepsilon} \left( \text{Fp} \int_0^\infty \frac{\phi(x) dx}{\ln p} + \psi(\varepsilon) \right) + \sum_{j=m+1}^{\infty} \frac{a_j e^{\alpha_j}}{1 - p^{j+\alpha_j}}.
\]

(4.11)

as \( \varepsilon \to 0^+ \), if \( \phi(x) \sim a_1 x^{\alpha_1} + a_2 x^{\alpha_2} + a_3 x^{\alpha_3} + \cdots \) as \( x \to 0^+ \). Here \( \alpha_m = -1 \) and the oscillatory component \( \psi(\varepsilon) = \phi(\hat{\phi}; \varepsilon) \) is a periodic function of \( \ln \varepsilon \) of period \( \ln p \) and zero mean.

Let us now replace \( \phi(x) \) by \( \phi(x)/x \) in formula (4.11). Since \( \phi(x)/x \) has the expansion

\[
a_1 x^{\alpha_1 - 1} + a_2 x^{\alpha_2 - 1} + a_3 x^{\alpha_3 - 1} + \cdots \text{ as } x \to 0^+,
\]

we obtain the formula

\[
\sum_{n=0}^{\infty} \phi(x^{p^n}) \sim \sum_{j=1}^{k-1} \frac{a_j e^{\alpha_j}}{1 - p^{j+\alpha_j}} - \frac{a_k \ln \varepsilon}{\ln p} + \frac{1}{\varepsilon} \left( \text{Fp} \int_0^\infty \frac{\phi(x) x^{-1} dx}{\ln p} + \psi(\varepsilon) \right) + \sum_{j=k+1}^{\infty} \frac{a_j e^{\alpha_j}}{1 - p^{j+\alpha_j}},
\]

(4.12)

where \( \alpha_k = 0 \) and where \( \psi(\varepsilon) \) is a periodic function of \( \ln \varepsilon \) of period \( \ln p \) and zero mean.

In particular, if \( \phi \in S' \{x^{\alpha} \ln x, x^{\alpha} \} \), the formula (4.12) takes the form

\[
\sum_{n=0}^{\infty} \phi(x^{p^n}) \sim -\phi(0) \ln \varepsilon \ln p + \frac{1}{\varepsilon} \left( \text{Fp} \int_0^\infty \frac{\phi(x) x^{-1} dx}{\ln p} + \psi(\varepsilon) \right) + \sum_{n=1}^{\infty} \frac{\phi^{(n)}(0) x^n}{n!(1 - p^n)}. \tag{4.13}
\]

5. REGULARIZATION IN \( S'\{x^{\alpha} \ln x, x^{\alpha} \} \).

The same regularization procedure can be applied to the space \( S'\{x^{\alpha} \ln x, x^{\alpha} \} \). Indeed, we use the finite part values

\[
(f_-(x), x^{-1} \ln x) = -\ln p \text{Fp} \sum_{n=1}^{\infty} n = 0.
\]

(5.1)

\[
(f_-(x), x^{\alpha} \ln x) = -\ln p \sum_{n=1}^{\infty} n p^{-n(\alpha + 1)} = -\frac{p^{1+\alpha} \ln p}{(p^{1+\alpha} - 1)^2}, \quad \alpha < -1.
\]

(5.2)

to obtain the regularization of \( f_-(x) \) and, consequently, of \( f(x) \). The generalized function \( f(x) \) remains a periodic function of \( \ln x \), of period \( \ln p \).

Formula (4.7) becomes

\[
\text{Fp} \int_0^\infty \frac{\phi(x) dx}{\ln p} = \frac{1}{\varepsilon} \left[ \text{Fp} \int_0^\infty \phi(x) dx - a_m \ln \varepsilon - a_m' \frac{(\ln \varepsilon)^2}{2} \right].
\]

\[
f(x) \sim \sum_{j=1}^{\infty} \phi(x) = \sum_{j=1}^{\infty} [a_j' \ln x + a_j p^{\alpha_j} \ln p] \varepsilon^{\alpha_j}
\]

(5.3)

if \( \phi(x) \sim \sum_{j=1}^{\infty} [a_j' \ln x + a_j p^{\alpha_j} \ln p] \varepsilon^{\alpha_j} \), as \( x \to 0^+ \) and \( \alpha_m = -1 \).

The asymptotic formula then takes the form

\[
\sum_{n=0}^{\infty} \phi(x^{p^n}) \sim \sum_{j=1}^{k-1} \left[ a_j' \ln \varepsilon + a_j p^{\alpha_j} \ln p \right] \varepsilon^{\alpha_j}
\]

(5.4)
where \( \alpha_k = 0 \).

6. AN ILLUSTRATION.

There are some Tauberian theorems, which go back to Hardy and Littlewood [9], for the differentiation of asymptotic approximations which are valid under appropriate monotonicity conditions [2]. For instance, if

\[
G(x) \sim e^{\lambda x}, \quad \text{as } x \to \infty.
\]

(6.1)

where \( \lambda \neq 0 \), and if \( G' \) is increasing, then

\[
G'(x) \sim e^{\lambda x}.
\]

(6.2)

The corresponding Tauberian theorems for comparison with a power function also hold, namely, if

\[
F(x) \sim (x - a)^\alpha, \quad \text{as } x \to a^+.
\]

(6.3)

and if \( F' \) is increasing and \( \alpha > 1 \) or \( \alpha < 0 \) or \( F' \) is decreasing and \( 0 < \alpha < 1 \), then

\[
F'(x) \sim \alpha(x - a)^{\alpha - 1}, \quad \text{as } x \to a^+.
\]

(6.4)

Therefore, it is surprising that the results for comparison with a logarithmic function are false [2]. A simple counterexample can be constructed by using the asymptotic approximations of the previous sections. Indeed, let \( p > 1 \) and set

\[
f(x) = \sum_{n=0}^{\infty} x^n, \quad 0 < x < 1.
\]

(6.5)

The behavior of \( f(x) \) as \( x \to 1^- \) can be found from (4.13) by taking \( x = e^{-\varepsilon}, \varepsilon = \ln(1/x) \) and \( \phi(x) = e^{-x} \). The result is

\[
f(x) \sim -\frac{\ln \ln(1/x)}{\ln p} - \gamma + \omega(\ln \ln(1/x)) + \sum_{n=1}^{\infty} \frac{(\ln x)^n}{n!(1 - p^n)}, \quad \text{as } x \to 1^-,
\]

(6.6)

where we have used the value \( \gamma = \int_0^{\infty} e^{-x} \frac{dx}{x} \), Euler's constant, and where \( \omega \) is a periodic function of period \( \ln p \) and zero mean.

To the first order, (6.6) takes the form

\[
f(x) \sim \frac{\ln \frac{1}{1-x}}{\ln p}, \quad \text{as } x \to 1^-.
\]

(6.7)

But \( f'(x) \), though increasing, is not asymptotically equivalent to \( \frac{1}{(1-x)\ln p} = \frac{d}{dx} \left[ \frac{\ln \frac{1}{1-x}}{\ln p} \right] \).

Actually, using (4.11) we find the approximation

\[
f'(x) = \sum_{n=0}^{\infty} p^n x^{p^n - 1} = \frac{1}{x} \sum_{n=0}^{\infty} p^n x^{p^n}
\sim \frac{1}{x} \left[ \frac{1}{\ln p \ln(1/x)} + \omega_1(\ln \ln(1/x)) + \sum_{n=0}^{\infty} \frac{(\ln x)^n}{n!(1 - p^{n+1})} \right], \quad \text{as } x \to 1^-.
\]

(6.8)
To the first order, then,

\[ f'(x) \sim \frac{1}{1 - x} \left[ \frac{1}{\ln p} + \omega_1 \left( \ln \ln \frac{1}{x} \right) \right], \]  

so that \( f'(x)(1 - x) \ln p \) does not tend to 1, but rather it oscillates about it since \( \omega_1 \) is a periodic function with zero mean.

Special Issue on
Singular Boundary Value Problems for Ordinary Differential Equations

Call for Papers

The purpose of this special issue is to study singular boundary value problems arising in differential equations and dynamical systems. Survey articles dealing with interactions between different fields, applications, and approaches of boundary value problems and singular problems are welcome.

This Special Issue will focus on any type of singularities that appear in the study of boundary value problems. It includes:

- Theory and methods
- Mathematical Models
- Engineering applications
- Biological applications
- Medical Applications
- Finance applications
- Numerical and simulation applications

Before submission authors should carefully read over the journal's Author Guidelines, which are located at http://www.hindawi.com/journals/bvp/guidelines.html. Authors should follow the Boundary Value Problems manuscript format described at the journal site http://www.hindawi.com/journals/bvp/. Articles published in this Special Issue shall be subject to a reduced Article Processing Charge of €200 per article. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:

<table>
