This note presents the characterization of the stability set of the first kind for multiobjective nonlinear programming (MONLP) problems with fuzzy parameters either in the constraints or in the objective functions without any differentiability assumptions. These fuzzy parameters are characterized by triangular fuzzy numbers (TFNs). The existing results concerning the parametric space in convex programs are reformulated to study for multiobjective nonlinear programs under the concept of $\alpha$-Pareto optimality.

1. Introduction

This note gives the characterization of the stability set of the first kind for convex multiobjective nonlinear programming (MONLP) problems with fuzzy parameters in the constraints and for convex MONLP problems with fuzzy parameters in the objective functions. These fuzzy parameters are characterized by TFNs and treatment under the concept of $\alpha$-Pareto optimality. In this note, no differentiability assumptions are needed and the KTSP is used in the derivation of the proposed results.
2. Problem formulation

We consider the following convex MONLP problem with fuzzy parameters in the right-hand side of constraints:

\[
\begin{align*}
\min & \quad (f_1(x), \ldots, f_m(x)) \\
\text{subject to} & \quad x \in X(\bar{\nu}) = \{ x \in \mathbb{R}^n : g_j(x) \leq \bar{\nu}_j, \ j = 1, 2, \ldots, k \},
\end{align*}
\]

where the functions \( f_i(x), i = 1, 2, \ldots, m \), and \( g_j(x), j = 1, 2, \ldots, k \), are assumed to be convex on \( \mathbb{R}^n \) and \( \bar{\nu}_j, j = 1, 2, \ldots, k \), are any real fuzzy parameters which are characterized by real fuzzy numbers that form a convex continuous fuzzy subset of the real line whose membership functions are \( \mu_{\bar{\nu}_j}(\nu_j) \), \( j = 1, 2, \ldots, k \). There is an infinite set of fuzzy numbers, but here we will define a special class of fuzzy numbers called TFNs which can be defined by a triplet \((\nu^1, \nu^2, \nu^3)\), that is, the membership functions \( \mu_{\bar{\nu}_j}(\nu_j) \), \( j = 1, 2, \ldots, k \), are functions of \( \nu_t, t = 1, 2, 3 \). These membership functions are nondifferentiable on \([\nu^1_j, \nu^3_j]\), \( j = 1, 2, \ldots, k \).

Definition 2.1. The \( \alpha \)-level set of the fuzzy numbers \( \bar{\nu}_j \), \( j = 1, 2, \ldots, k \), is defined as the ordinary set \( L_\alpha(\bar{\nu}) \) for which the degree of their membership functions exceeds the level \( \alpha \) [1]:

\[
L_\alpha(\bar{\nu}) = \{ \nu : \mu_{\bar{\nu}_j}(\nu_j) \geq \alpha, \ j = 1, 2, \ldots, k \}.
\]

For a certain degree of \( \alpha \), the MONLP problem (2.1)-(2.2) can be written in the following nonfuzzy form [9]:

\[
\begin{align*}
\min & \quad (f_1(x), \ldots, f_m(x)) \\
\text{subject to} & \quad N(\nu) = \{ (x, \nu) \in \mathbb{R}^{n+k} : g_j(x) \leq \nu_j, \ j = 1, 2, \ldots, k; \ \mu_{\bar{\nu}_j}(\nu_j) \geq \alpha, \ j = 1, 2, \ldots, k \}.
\end{align*}
\]

The scalarization form for the problem (2.5)–(2.6) is

\[
\min \Sigma_{i=1}^m w_i f_i(x) \]
subject to

\[(x, v) \in N(v), \quad (2.8)\]

where \(w_i \geq 0, i = 1, 2, \ldots, m\), for at least one \(i\) satisfying \(w_i > 0\) and \(\sum_{i=1}^{m} w_i = 1\).

**Definition 2.2.** For a certain degree of \(\alpha\), suppose that the problem (2.7)–(2.8) is solvable for \((w, v') = (\bar{w}, \bar{v})\) with an \(\alpha\)-optimal point \((\bar{x}, \bar{v})\), then the \(\alpha\)-stability set of the first kind of problem (2.7)–(2.8) corresponding to \((\bar{x}, \bar{v})\) denoted by \(S(\bar{x}, \bar{v})\) is defined by

\[
S(\bar{x}, \bar{v}) = \left\{ (w, v') \in \mathbb{R}^{m+3k} : \sum_{i=1}^{m} w_i f_i(\bar{x}) = \min_{(x, v) \in N(v)} \sum_{i=1}^{m} w_i f_i(x) \right\},
\]

where \(\mathbb{R}^m\) is the \(m\)-dimensional vector space of weights and \(\mathbb{R}^{3k}\) is the \(3k\)-dimensional vector space of fuzzy parameters which are characterized by TFNs.

**Lemma 2.3.** For a certain degree of \(\alpha\), if the problem (2.7)–(2.8) is stable for all \((w, v')\) such that \(N(v) \neq \phi\), then \(g(\bar{x}) = \bar{v}, \mu_\bar{v}(\bar{v}') = \alpha, (\bar{w}, \bar{v}') \in S(\bar{x}, \bar{v})\).

**Proof.** If \(S(\bar{x}, \bar{v}) = \{(\bar{w}, \bar{v}')\}\), then the result is clear. Assume that \((\hat{w}, \hat{v}') \in S(\bar{x}, \bar{v}), (\bar{w}, \bar{v}') \neq (\hat{w}, \hat{v}')\) and by the assumption and from the KTSP necessary optimality theorem [6], it follows that \((\bar{x}, \bar{v})\) and some \(\hat{u} \geq 0, \hat{v} \geq 0\) solve KTSP and \(\hat{u}_j g_j(\bar{x} - \bar{v}) = 0, \hat{v}_j (\alpha - \mu_{\bar{v}}(\hat{v}_j')) = 0\), that is, for \(\alpha = \bar{\alpha}\), we have

\[
\tau(\bar{x}, \bar{w}, \bar{v}, u, \eta, \hat{v}') \leq \tau(\bar{x}, \bar{w}, \bar{v}, \hat{u}, \hat{v}, \hat{v}') \leq \tau(x, w, v, \hat{u}, \hat{v}) \quad (2.10)
\]

for all \((x, v) \in N(v)\) and for all \(u \geq 0, \eta \geq 0\) and \(\hat{u}[g(\bar{x}) - \bar{v}] = 0, \hat{v}[(\bar{\alpha} - \mu_{\bar{v}}(\hat{v}_j')) = 0\), where

\[
\tau(x, w, v, u, \eta, v') = \sum_{i=1}^{m} w_i f_i(x) + \sum_{j=1}^{k} u_j [g_j(x) - v_j] - \sum_{i=1}^{m} \eta_i \mu_{\bar{v}}(v_i') - \alpha
\]

since \(\hat{u}_j g_j(\bar{x}) = \hat{u}_j, j = 1, 2, \ldots, k\), and \(\hat{v}_i \mu_{\bar{v}}(\hat{v}_i') = \hat{v}_i \bar{\alpha}\). Then

\[
\tau(\bar{x}, \bar{w}, \bar{v}, u, \eta, \hat{v}') \leq \sum_{i=1}^{m} \bar{w}_i f_i(\bar{x}) \leq \tau(x, w, v, \hat{u}, \hat{v}), \quad (2.12)
\]

from which it follows that

\[
\tau(\bar{x}, \bar{w}, \bar{v}, u, \eta, \hat{v}') \leq \tau(\bar{x}, \bar{w}, \bar{v}, \hat{u}, \hat{v}', \hat{v}') \leq \tau(x, w, v, \hat{u}, \hat{v}),
\]

therefore, from the KTSP sufficient optimality theorem, it follows that \(g(\bar{x}) = \bar{v}, \mu_{\bar{v}}(\bar{v}') = \bar{\alpha}\), that is, \((\bar{w}, \bar{v}') \in S(\bar{x}, \bar{v})\). 

**Theorem 2.4.** For a certain degree of \(\alpha\), if the problem (2.7)–(2.8) is stable for all \((w, v')\) such that \(N(v) \neq \phi\), then the set \(S(\bar{x}, \bar{v})\) is star shaped with point of common visibility \(\bar{v} = g(\bar{x})\), \(\bar{\alpha} = \mu_{\bar{v}}(\bar{v}')\) and closed.
Proof. From the previous lemma, it follows that \((\bar{w}, \bar{v}') \in S(\bar{x}, \bar{v})\). Let other point \((\tilde{w}, \tilde{v}') \in S(\bar{x}, \bar{v})\), then by the assumption and from the KTSP necessary optimality theorem, it follows that \((\bar{x}, \bar{v})\) and some \(\tilde{u} \geq 0\), \(\tilde{\eta} \geq 0\) solve KTSP \([6]\) and \(\tilde{u}[g(\bar{x}) - \bar{v}] = 0\), \(\tilde{\eta}[\bar{v} - \mu_\bar{v}(\tilde{v}')] = 0\), then for all \((x, v) \in \mathbb{R}^{n+k}, u \geq 0, \eta \geq 0\), we have

\[
\tau(x, \bar{w}, \bar{v}, u, \eta, \tilde{v}') \leq \tau(x, \bar{w}, \bar{v}, \tilde{u}, \tilde{\eta}, \tilde{v}') \leq \tau(x, w, v, \tilde{u}, \tilde{\eta}, \tilde{v}'),
\]

and \(\tilde{u}_j[g_j(\bar{x}) - \bar{v}_j] = 0\), \(\tilde{\eta}_r[\bar{v} - \mu_\bar{v}(\tilde{v}')] = 0\). Putting \(u_j = yU_j, \zeta_r = y\eta_r, w_i = yW_i, \gamma \geq 0\), and \((1 - \gamma)\tilde{u}_j[g_j(\bar{x}) - \bar{v}_j] = 0\), \((1 - \gamma)\tilde{\eta}_r[\bar{v} - \mu_\bar{v}(\tilde{v}')] = 0\).

For a certain degree of \(\alpha = \bar{\alpha}\), we deduce from the relation \((2.14)\) that

\[
\Sigma_{i=1}^m \tilde{w}_i f_i(\bar{x}) + \Sigma_{j=1}^k u_j[g_j(\bar{x}) - \bar{v}_j] - \Sigma_{r=1}^k \tilde{\eta}_r[\mu_\bar{v}_r(\tilde{v}') - \alpha] \\
\leq \Sigma_{i=1}^m \tilde{w}_i f_i(\bar{x}) + \Sigma_{j=1}^k \tilde{u}_j[g_j(\bar{x}) - \bar{v}_j] - \Sigma_{r=1}^k \tilde{\eta}_r[\mu_\bar{v}_r(\tilde{v}') - \alpha] \\
\leq \Sigma_{i=1}^m w_i f_i(x) + \Sigma_{j=1}^k \tilde{u}_j[g_j(x) - \bar{v}_j] - \Sigma_{r=1}^k \tilde{\eta}_r[\mu_\bar{v}_r(\tilde{v}') - \alpha].
\]

That is, for all \(U \geq 0, \zeta \geq 0\), and \(\gamma \geq 0\), we have

\[
\Sigma_{i=1}^m \tilde{w}_i f_i(\bar{x}) - (1 - \gamma) f_i(\bar{x})] + \Sigma_{j=1}^k \tilde{u}_j[g_j(\bar{x}) - \bar{v}_j] \\
- \Sigma_{r=1}^k \tilde{\eta}_r[\mu_\bar{v}_r(\tilde{v}') - \alpha] \\
\leq \Sigma_{i=1}^m \tilde{w}_i f_i(\bar{x}) + \Sigma_{j=1}^k \tilde{u}_j[g_j(\bar{x}) - \bar{v}_j] - \Sigma_{r=1}^k \tilde{\eta}_r[\mu_\bar{v}_r(\tilde{v}') - \alpha] \\
\leq \Sigma_{i=1}^m w_i f_i(x) - (1 - \gamma) f_i(x)] + \Sigma_{j=1}^k \tilde{u}_j[g_j(x) - \bar{v}_j] \\
- \Sigma_{r=1}^k \tilde{\eta}_r[(\mu_\bar{v}_r(\tilde{v}') - \alpha) - (1 - \gamma) (\mu_\bar{v}_r(\tilde{v}') - \alpha)].
\]

Therefore, it follows from the KTSP sufficient optimality theorem and from the relation \((2.16)\) that \((1 - \gamma)w_i f_i(\bar{x}), (1 - \gamma)g_i(x) + y\bar{v}, and y\bar{v} - (1 - \gamma)\mu_\bar{v}(\tilde{v}')[\bar{x}]\) belong to \(S(\bar{x}, \bar{v})\) for all \(\gamma \geq 0\). Hence the set \(S(\bar{x}, \bar{v})\) is star shaped with point of common visibility \((\bar{w}, \bar{v}')\).

If the set \(S(\bar{x}, \bar{v})\) is a one-point set or the whole space, then it is clearly closed. Choose a sequence of points \((w^{(n)}, v^{(n)}) \in S(\bar{x}, \bar{v})\) which is convergent to \((w, v')\), that is, \(\lim_{n \to \infty}(w^{(n)}, v^{(n)}) = (w, v')\). Then \(\Sigma_{i=1}^m w_i f_i(\bar{x}) \leq \Sigma_{i=1}^m w_i f_i(x)\) for all \(g(x) \leq v'^{n}, \mu_\bar{v}(v'^{n}) \geq \alpha, n = 1, 2, \ldots\). Taking the limit as \(n \to \infty\), we get for all \(g(x) \leq v', \mu_\bar{v}(v') \geq \alpha\) that

\[
\Sigma_{i=1}^m w_i f_i(\bar{x}) \leq \Sigma_{i=1}^m w_i f_i(x),
\]

that is, \((w, v') \in S(\bar{x}, \bar{v})\), and therefore the set \(S(\bar{x}, \bar{v})\) is closed.

Theorem 2.5. For a certain degree of \(\alpha\), if the problem \((2.7) - (2.8)\) is stable for all \((w, v')\) such that \(N(\nu) \neq \phi\), then the set \(S(\bar{x}, \bar{v})\) is either one-point set or unbounded.
Proof. If the set \( S(\overline{x}, \overline{v}) \) consists only of one point, then it is clear that this point is \( \overline{v}_j = g_j(\overline{x}), \mu_{\overline{v}_j}(\overline{v}_j) \geq \alpha \). If \( S(\overline{x}, \overline{v}) \) contains another point \((w', v')\), then it is clear from (2.16) and from the KTSP sufficient optimality theorem that
\[
\{(w, v') \in \mathbb{R}^{m+3k} : (1-\gamma)w' f(\overline{x}), (1-\gamma)g(\overline{x}) + \gamma v', (1-\gamma)\mu_v(v') - \gamma \alpha \} \subseteq S(\overline{x}, \overline{v}), \quad \gamma \geq 0,
\]
that is, implying that the set \( S(\overline{x}, \overline{v}) \) is unbounded. \( \square \)

3. Fuzzy parameters in the objective functions

We consider the following convex MONLP problem with fuzzy parameters in the objective functions:

\[
\min f_1(x, \tilde{\lambda}_1), \ldots, f_m(x, \tilde{\lambda}_m) \tag{3.1}
\]
subject to
\[
x \in X = \{x \in \mathbb{R}^n : g_j(x) \leq 0, \ j = 1, 2, \ldots, k\}, \tag{3.2}
\]
where the functions \( f_i(x, \lambda_i), \ i = 1, 2, \ldots, m, \) and \( g_j(x), \ j = 1, 2, \ldots, k, \) are assumed to be convex on \( \mathbb{R}^n \) and \( \tilde{\lambda} \in \mathbb{R}^m \) is the \( m \)-dimensional vector space of fuzzy parameters which are characterized by TFNs.

The corresponding scalarization problem with fuzzy parameters is

\[
\min \Sigma_{i=1}^m w_i f_i(x, \tilde{\lambda}_i) \tag{3.3}
\]
subject to
\[
x \in X, \tag{3.4}
\]
where \( w_i \geq 0, \ i = 1, 2, \ldots, m, \) for at least one \( i \) satisfying \( w_i > 0 \) and \( \Sigma_{i=1}^m w_i = 1 \).

For a certain degree of \( \alpha \), the above problem can be written in the following nonfuzzy form [9]:

\[
\min F(x, w, \lambda) = \Sigma_{i=1}^m w_i f_i(x, \lambda_i) \tag{3.5}
\]
subject to
\[
M(\lambda) = \{(x, \lambda) \in \mathbb{R}^{n+m} : g_j(x) \leq 0, \ j = 1, 2, \ldots, k; \mu_{\tilde{\lambda}_i}(\lambda_i) \geq \alpha, \ i = 1, 2, \ldots, m\}, \tag{3.6}
\]
where \( \mu_{\tilde{\lambda}_i}(\lambda_i), \ i = 1, 2, \ldots, m, \) are defined as the previous form of \( \mu_{\overline{v}_j}(v_j) \), which are non-differentiable on \([\lambda_i^1, \lambda_i^3]\).

Definition 3.1. For a certain degree of \( \alpha \), suppose that the problem (3.5)–(3.6) is solvable for \((w, \lambda) = (\overline{w}, \overline{\lambda})\) with an \( \alpha \)-optimal point \((\overline{x}, \overline{\lambda})\), then the \( \alpha \)-stability set of the first kind of problem (3.5)–(3.6) corresponding to \((\overline{x}, \overline{\lambda})\) denoted by \( T(\overline{x}, \overline{\lambda}) \) is defined by

\[
T(\overline{x}, \overline{\lambda}) = \{(w, \lambda') \in \mathbb{R}^{4m} : \Sigma_{i=1}^m w_i f_i(\overline{x}, \overline{\lambda}_i) = \min_{(x, \lambda) \in M(\lambda)} \Sigma_{i=1}^m w_i f_i(x, \lambda_i)\}, \tag{3.7}
\]
Theorem 3.2. For a certain degree of $\alpha$, the set $T(\bar{x}, \bar{\lambda})$ is convex and closed.

Proof. For a certain degree of $\alpha$, if the set $T(\bar{x}, \bar{\lambda})$ is a one-point set or the whole space, it is clearly convex and closed. Suppose that $(w^1, \lambda^1)$ and $(w^2, \lambda^2)$ are any two points in $T(\bar{x}, \bar{\lambda})$, then for all $(x, \lambda) \in M(\lambda)$, we have

$$
\tau(\bar{x}, w^1, \bar{\lambda}, u, \eta, \bar{\lambda}^1) \leq \tau(\bar{x}, w^1, \bar{\lambda}, \hat{u}, \hat{\eta}, \bar{\lambda}^1),
$$

$$
\tau(\bar{x}, w^2, \bar{\lambda}, u, \eta, \bar{\lambda}^1) \leq \tau(\bar{x}, w^2, \bar{\lambda}, \hat{u}, \hat{\eta}, \bar{\lambda}^1),
$$

where

$$
\tau(x, w, \lambda, u, \eta, \lambda^t) = \sum_{i=1}^m w_i f_i(x, \lambda) + \sum_{j=1}^k u_j g_j(x) - \sum_{r=1}^m \eta_r (\mu_{\lambda_r}(\lambda_r) - \alpha).
$$

Therefore,

$$
\tau(\bar{x}, \hat{w}, \bar{\lambda}, u, \eta, \lambda^t) \leq \tau(\bar{x}, \hat{w}, \bar{\lambda}, \hat{u}, \hat{\eta}, \lambda^t) \leq \tau(\bar{x}, \hat{w}, \lambda, \hat{u}, \hat{\eta}, \lambda^t),
$$

where $\hat{w} = (1 - \gamma)w^1 + \gamma w^2$, $\bar{\lambda}^t = (1 - \gamma)\bar{\lambda}^1 + \gamma \bar{\lambda}^2$, $0 \leq \gamma \leq 1$, that is, $(\hat{w}, \lambda^t) \in T(\bar{x}, \bar{\lambda})$, hence the set $T(\bar{x}, \bar{\lambda})$ is convex.

We choose a sequence of points $(w^{(n)}, \lambda^{n}) \in T(\bar{x}, \bar{\lambda})$ which is convergent to $(\bar{w}, \lambda^t)$, then

$$
\tau(\bar{x}, w^{(n)}, \bar{\lambda}, u, \eta, \lambda^{n}) \leq \tau(\bar{x}, w^{(n)}, \lambda, \hat{u}, \hat{\eta}, \lambda^{n}) \quad \forall (x, \lambda) \in M(\lambda), \quad n = 1, 2, \ldots.
$$

Taking the limit as $n \to \infty$, we have

$$
\lim_{n \to \infty} \tau(\bar{x}, w^{(n)}, \bar{\lambda}, u, \eta, \lambda^{n}) \leq \lim_{n \to \infty} \tau(\bar{x}, w^{(n)}, \lambda, \hat{u}, \hat{\eta}, \lambda^{n}) \quad \forall (x, \lambda) \in M(\lambda).
$$

From the finiteness of the sum, we get

$$
\tau\left(\bar{x}, \lim_{n \to \infty} w^{(n)}, \bar{\lambda}, u, \eta, \lim_{n \to \infty} \lambda^{n}\right) \leq \tau\left(\bar{x}, \lim_{n \to \infty} w^{(n)}, \lambda, \hat{u}, \hat{\eta}, \lim_{n \to \infty} \lambda^{n}\right), \quad \forall (x, \lambda) \in M(\lambda),
$$

therefore,

$$
\tau(\bar{x}, \bar{w}, \bar{\lambda}, u, \eta, \bar{\lambda}^t) \leq \tau(\bar{x}, w, \lambda, \hat{u}, \hat{\eta}, \bar{\lambda}^t) \quad \forall (x, \lambda) \in M(\lambda),
$$

that is, $(\bar{w}, \bar{\lambda}^t) \in T(\bar{x}, \bar{\lambda})$, and hence the set $T(\bar{x}, \bar{\lambda})$ is closed. 

\[\square\]
Theorem 3.3. For a certain degree of $\alpha$, the set $T(\bar{x}, \bar{\lambda})$ is a cone with vertex at the origin.

Proof. It is clear that $(w, \lambda^t) = (0, 0) \in T(\bar{x}, \bar{\lambda})$. Suppose that $(\hat{w}, \hat{\lambda}^t) \in T(\bar{x}, \bar{\lambda})$, then

$$\tau(\bar{x}, \hat{w}, \bar{\lambda}, u, \eta, \hat{\lambda}^t) \leq \tau(x, \hat{w}, \lambda, u, \eta, \hat{\lambda}^t) \quad \forall (x, \lambda) \in M(\lambda),$$

(3.15)

therefore,

$$\tau(\bar{x}, \gamma \hat{w}, \bar{\lambda}, u, \eta, \gamma \hat{\lambda}^t) \leq \tau(x, \gamma \hat{w}, \lambda, u, \eta, \gamma \hat{\lambda}^t) \quad \forall (x, \lambda) \in M(\lambda),$$

(3.16)

and $\gamma \geq 0$, that is, $(\gamma \hat{w}, \gamma \hat{\lambda}^t) \in T(\bar{x}, \bar{\lambda})$ for all $\gamma \geq 0$, hence the result follows.

Lemma 3.4. For a certain degree of $\alpha$, if problem (3.5)–(3.6) is stable for all $(w, \lambda^t)$ such that $M(\lambda) \neq \phi$, then $\bar{\alpha} = \mu_3(\bar{\lambda}_i)$, $(w, \lambda^t) \in T(\bar{x}, \bar{\lambda})$.

Proof. If $T(\bar{x}, \bar{\lambda}) = \{(\bar{w}, \bar{\lambda})\}$, then the result is clear. Assume that $(\hat{w}, \hat{\lambda}^t) \in T(\bar{w}, \bar{\lambda})$, $(\hat{w}, \hat{\lambda}^t) \neq (\bar{w}, \bar{\lambda})$, then by the assumption and from the KTSP necessary optimality theorem [6], it follows that $(\bar{x}, \bar{\lambda})$ and some $\tilde{\xi} \in \mathbb{R}^m$, $\tilde{\xi} \geq 0$ solve KTSP and $\xi_i[\alpha - \mu_3(\bar{\lambda}^t_i)] = 0$, that is, for all $(x, \lambda) \in M(\lambda)$, and for all $u \geq 0$, $\xi \geq 0$, we have

$$\tau(x, w, \lambda, u, \xi, \hat{\lambda}^t) \leq \tau(x, \bar{w}, \bar{\lambda}, \hat{u}, \tilde{\xi}, \hat{\lambda}^t) \quad \forall (\bar{w}, \bar{\lambda}) \in T(\bar{x}, \bar{\lambda}).$$

(3.17)

and $\hat{u}g(x) = 0$, $\tau(x, w, \lambda, u, \xi, v^t) = \Sigma_{i=1}^m w_i f_i(x, \lambda) + \Sigma_{j=1}^k u_j g_j(x) - \Sigma_{i=1}^k \xi_i(\alpha - \mu_3(\lambda^t_i))$ since $\hat{u}g(\bar{x}) = 0$ and $\tilde{\xi} \mu_3(\hat{\lambda}^t) = \tilde{\xi} \bar{\alpha}$ for certain degree of $\alpha = \bar{\alpha}$. Then

$$\tau(x, \bar{w}, \bar{\lambda}, u, \xi, \hat{\lambda}^t) \leq \Sigma_{i=1}^m \bar{w}_i f_i(\bar{x}, \bar{\lambda}) \leq \tau(x, w, \lambda, u, \xi, \hat{\lambda}^t),$$

(3.18)

from which it follows that

$$\tau(x, \hat{w}, \bar{\lambda}, u, \xi, \hat{\lambda}^t) \leq \tau(x, \hat{w}, \bar{\lambda}, \hat{u}, \tilde{\xi}, \hat{\lambda}^t),$$

(3.19)

therefore from the KTSP sufficient optimality theorem, it follows that $\mu_3(\hat{\lambda}^t) = \bar{\alpha}$, $(\hat{w}, \hat{\lambda}^t) \in T(\bar{x}, \bar{\lambda})$.

Theorem 3.5. For a certain degree of $\alpha$, if the problem (3.5)–(3.6) is stable for all $(w, \lambda^t)$ such that $M(\lambda) \neq \phi$, then the set $T(\bar{x}, \bar{\lambda})$ is star shaped with point of common visibility $\mu_3(\bar{\lambda}^t) = \alpha$ and closed.

Proof. From the previous lemma, it follows that $(\bar{w}, \bar{\lambda}) \in T(\bar{x}, \bar{\lambda})$. Let another point $(\hat{w}, \hat{\lambda}^t) \in T(\bar{x}, \bar{\lambda})$, then by the assumption and from the KTSP necessary optimality theorem, it follows that $(\bar{x}, \bar{\lambda})$ and some $\bar{u} \geq 0$, $\tilde{\xi} \geq 0$ solve KTSP and $\bar{u}g(\bar{x}) = 0$, $\tilde{\xi}[\bar{\alpha} - \mu_3(\bar{\lambda}^t)] = 0$ for certain degree of $\alpha = \bar{\alpha}$, then for all $(x, \lambda) \in M(\lambda)$ and for all $u \geq 0$, $\xi \geq 0$, we have

$$\tau(x, \bar{w}, \bar{\lambda}, u, \xi, \hat{\lambda}^t) \leq \tau(x, \bar{w}, \bar{\lambda}, \hat{u}, \tilde{\xi}, \hat{\lambda}^t) \leq \tau(x, w, \lambda, u, \xi, \hat{\lambda}^t),$$

(3.20)

$\bar{u}_j g_j(\bar{x}) = 0$, $\tilde{\xi}_i[\bar{\alpha} - \mu_3(\bar{\lambda}^t_i)] = 0$ for certain degree of $\alpha = \bar{\alpha}$.
Putting $u_j = \gamma U_j$, $\xi_r = \gamma \zeta_r$, $w_i = \gamma W_i$, $\gamma \geq 0$, and $(1 - \gamma)\tilde{u}_j g_j(x) = 0$, $(1 - \gamma)\tilde{\xi}_r [\mu - \mu_\lambda^+ (\bar{\lambda}^j)] = 0$, we deduce from the relation (3.20) and for a certain degree of $\alpha = \bar{\alpha}$ that

$$\Sigma_{i=1}^m w_i f_i(x, \bar{\lambda}) + \Sigma_{j=1}^k u_j g_j(x) - \Sigma_{i=1}^m \xi_i [\mu_\lambda^+ (\bar{\lambda}^i) - \bar{\alpha}]$$

$$\leq \Sigma_{i=1}^m w_i f_i(x, \bar{\lambda}) + \Sigma_{j=1}^k \tilde{u}_j g_j(x) - \Sigma_{i=1}^m \tilde{\xi}_i [\mu_\lambda^+ (\bar{\lambda}^i) - \bar{\alpha}]$$

$$\leq \Sigma_{i=1}^m w_i f_i(x, \lambda) + \Sigma_{j=1}^k \tilde{u}_j g_j(x) - \Sigma_{i=1}^m \tilde{\xi}_i [\mu_\lambda^+ (\bar{\lambda}^i) - \bar{\alpha}].$$

Then,

$$\Sigma_{i=1}^m \tilde{w}_i [ f_i(x, \bar{\lambda}) - (1 - \gamma) f_i(x, \bar{\lambda}) ] + \Sigma_{j=1}^k \tilde{U}_j [ g_j(x) - (1 - \gamma)g_j(x) ]$$

$$- \Sigma_{i=1}^m \tilde{\xi}_i [\mu_\lambda^+ (\bar{\lambda}^i) - \alpha - (1 - \gamma)(\mu_\lambda^+ (\bar{\lambda}^i) - \alpha)]$$

$$\leq \Sigma_{i=1}^m \tilde{w}_i [ f_i(x, \lambda) - (1 - \gamma) f_i(x, \lambda) ] + \Sigma_{j=1}^k \tilde{U}_j [ g_j(x) - (1 - \gamma)g_j(x) ]$$

$$- \Sigma_{i=1}^m \tilde{\xi}_i [\mu_\lambda^+ (\bar{\lambda}^i) - \alpha - (1 - \gamma)(\mu_\lambda^+ (\bar{\lambda}^i) - \alpha)] \quad \forall U \geq 0, \xi \geq 0, \gamma \geq 0.$$

Therefore, it follows from the KTSP sufficient optimality theorem and from the above relation that $(1 - \gamma)w_i f_i(x, \bar{\lambda}), (1 - \gamma)g_j(x)$, and $y\bar{\alpha} - (1 - \gamma)\mu_\lambda^+ (\bar{\lambda})$ belong to $T(x, \bar{\lambda})$ for all $\gamma \geq 0$. Hence the set $T(x, \bar{\lambda})$ is star shaped with point of common visibility $(\bar{\pi}, \bar{\lambda})$. If the set $T(x, \bar{\lambda})$ is a one-point set or the whole space, then it is clearly closed. Choose a sequence of points $(w(n), \lambda^n) \in T(x, \bar{\lambda})$ which is convergent to $(w, \lambda')$, that is, $\lim_{n \to \infty} (w(n), \lambda^n) = (w, \lambda')$. Then

$$\Sigma_{i=1}^m w_i f_i(x, \bar{\lambda}) \leq \Sigma_{i=1}^m w_i f_i(x, \lambda) \quad \forall g(x) \leq 0, \quad \mu_\lambda (\lambda^n) \geq \alpha, \quad n = 1, 2, \ldots,$$

and as $n \to \infty$, we get

$$\Sigma_{i=1}^m w_i f_i(x, \bar{\lambda}) \leq \Sigma_{i=1}^m w_i f_i(x, \lambda) \quad \forall g(x) \leq 0, \quad \mu_\lambda (\lambda') \geq \alpha,$$

that is, $(w, \lambda') \in T(x, \bar{\lambda})$, and therefore the set $T(x, \bar{\lambda})$ is closed.

**Theorem 3.6.** For a certain degree of $\alpha$, if the problem (3.5)–(3.6) is stable for all $(w, \lambda')$ such that $M(\lambda) \neq \phi$, then the set $T(x, \bar{\lambda})$ is either one point set or unbounded.

**Proof.** For a certain degree of $\alpha$, if the set $T(x, \bar{\lambda})$ consists only of one point, then it is clear that this point is $(\bar{\pi}, \bar{\lambda})$. If $T(x, \bar{\lambda})$ contains another point $(w^1, \lambda^1)$, then it is clear from relation (3.20) and from the KTSP sufficient optimality theorem that

$$\{(w, \lambda') \in \mathbb{R}^{4m} : (1 - \gamma)w' f(x, \bar{\lambda}), (1 - \gamma)g(x), (1 - \gamma)\mu_\lambda (\lambda') - y\bar{\alpha} \} \subseteq T(x, \bar{\lambda}),$$

$\gamma \geq 0$, that is, the set $T(x, \bar{\lambda})$ is unbounded.
4. Conclusion

The stability set of the first kind for fuzzy parametric multiobjective nonlinear programming, which represents the set of all fuzzy parameters for which an $\alpha$-Pareto optimal point for one fuzzy parameter rests $\alpha$-Pareto optimal for all fuzzy parameters, has been analyzed qualitatively in the author’s notes [2, 3, 4], where all the functions are assumed to possess the first-order partial derivation on $\mathbb{R}^n$. In this note, no differentiability assumptions are needed and the KTSP necessary and sufficient optimality theorems are used in the derivation of the proposed results.

Future extension to this work is the characterization of the stability set of the first kind for MONLP with fuzzy parameters in both the objective functions and the constraints without any differentiability assumptions. Another field of extension is the field of fuzzy parametric nonconvex MONLP, where more difficulties may be found in the characterization of the stability set of the first kind of such problems.

Special Issue on
Singular Boundary Value Problems for Ordinary Differential Equations

Call for Papers

The purpose of this special issue is to study singular boundary value problems arising in differential equations and dynamical systems. Survey articles dealing with interactions between different fields, applications, and approaches of boundary value problems and singular problems are welcome.

This Special Issue will focus on any type of singularities that appear in the study of boundary value problems. It includes:

- Theory and methods
- Mathematical Models
- Engineering applications
- Biological applications
- Medical Applications
- Finance applications
- Numerical and simulation applications

Before submission authors should carefully read over the journal’s Author Guidelines, which are located at http://www.hindawi.com/journals/bvp/guidelines.html. Authors should follow the Boundary Value Problems manuscript format described at the journal site http://www.hindawi.com/journals/bvp/. Articles published in this Special Issue shall be subject to a reduced Article Processing Charge of €200 per article. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:

<table>
