INFINITE PRODUCTS OVER HYPERPYRAMID LATTICES

GEOFFREY B. CAMPBELL

(Received 2 July 1996)

Abstract. New infinite product identities are given, based on summed visible (from the origin) point vectors. Each result is found from summing on vpv lattices dividing space into radial regions from the origin. Recently, Baake et al. and Mosseri considered the 2-D visible lattice points as part of an optical experiment in which so-called Optical Fourier Transform was applied. Many of the techniques exposed by Glasser and Zucker, and Ninham et al. involving Mellin and Möbius inversions are also applicable to the current paper.

Keywords and phrases. Combinatorial identities, combinatorial number theory, lattice points in specified regions, partitions.

2000 Mathematics Subject Classification. Primary 05A19, 11B75, 11P21, 11P81.

1. A hyperpyramid theorem. In five recent papers by the author [8, 6, 7, 9, 5], some new infinite product identities were given. These were called visible (from the origin) point vector identities, or simply vpv identities. Each result was found from summing on vpv lattices dividing space into radial regions from the origin. Recently also (see Baake et al. [3] and Mosseri [12]) the visible lattice points were considered as part of an optical experiment in which the so-called Optical Fourier Transform was applied to the 2-D vpv’s. Apostol [2] gave an excellent introduction to the ideas behind vpv’s and calculated their density in space. Many of the techniques exposed in Glasser and Zucker [10], and in Ninham et al. [13] involving Mellin and Möbius inversions are applicable to vpv identities from the author’s papers [8, 6, 7, 9, 5] and to the current paper. In Andrew’s book on partitions [1], a historical perspective of generating functions for partitions, and an introduction to the works on plane partitions and vector partitions were given. The identities in the papers [8, 6, 7, 9, 5] and in the current paper are related to ideas from this book. Each vpv identity turns out to be combinatorially equivalent to a theorem on weighted vector partitions (see [6]). Here, we give two analogous theorems to the general one appearing in [7].

THEOREM 1.1. If \( i = 1, 2, \ldots, n \); then, for each \( \|x_n\|, \|x_n^*\|, \ldots, \|x_n^* \cdot \cdot \cdot x_1\| < 1 \), and \( b_i \in \mathbb{C} \),

\[
\exp \left\{ \sum_{k=1}^{n} \frac{x_k^n}{k^{bn}} \right\} \prod_{\{d_1, \ldots, d_n\} = 1}^{\infty} (1 - x_1^{d_1} \cdots x_n^{d_n} - \cdots - b_1 \cdots b_n) = \exp \left\{ \sum_{k=1}^{n} \prod_{j=1}^{k-1} \left( \sum_{j=1}^{k-1} \frac{x_j}{j^{b_j}} \right) \frac{x_k}{k^{bn}} \right\}, \quad \text{provided} \sum_{i=1}^{n} b_i = 1.
\]

\(1.1\)
This result is quite easy to prove using a technique in Campbell [8, 6, 7, 9, 5] by summing on the \( V_p \)'s in the \( n \)-space hyperpyramid, defined by the inequalities

\[
x_1 < x_n, \ x_2 < x_n, \ldots, \ x_{n-1} < x_n
\]  

(1.2)

in the first \( n \)-space hyperquadrant, and applying Lemma 1.6 below.

The corresponding theorem from Campbell [7] was summed very simply over all lattice point vectors in the first hyperquadrant. The approach we adopt to give the reader a feel for these identities is to take corollaries and then examples from them. The 2-D case through to the 5-D case of (1.1) are given in the following corollaries.

**Corollary 1.2.** If \( |yz| \) and \( |z| < 1 \), and \( S + t = 1 \), then

\[
\exp \left\{ \sum_{k \geq 1} \frac{z^k}{k!} \right\} \prod_{\substack{d < b \\ a > b; \ b < c \\ a > 0; \ b < c < 1}} (1 - y^az^b)^{-a - r - b - t} \]

(1.3)

\[
= \exp \left\{ \frac{z^1}{1^1} + \left(1 + \frac{y^1}{1^1}\right) \frac{z^2}{2^1} + \left(1 + \frac{y^1}{1^1} + \frac{y^2}{2^1}\right) \frac{z^3}{3^1} + \cdots \right\}. \]

**Corollary 1.3.** If \( |xyz|, |yz|, \) and \( |z| < 1 \), and \( r + s + t = 1 \), then

\[
\exp \left\{ \sum_{k \geq 1} \frac{z^k}{k!} \right\} \prod_{\substack{d < b \\ a > b < c \\ a > b, c < 1}} (1 - x^a y^b z^c)^{-a - r - b - c - t} \]

(1.4)

\[
= \exp \left\{ \frac{z^1}{1^1} + \left(1 + \frac{y^1}{1^1}\right) \frac{z^2}{2^1} + \left(1 + \frac{y^1}{1^1} + \frac{y^2}{2^1}\right) \frac{z^3}{3^1} + \cdots \right\}. \]

**Corollary 1.4.** If \( |xyz|, |xyz|, |yz|, \) and \( |z| < 1 \), and \( q + r + s + t = 1 \), then

\[
\exp \left\{ \sum_{k \geq 1} \frac{z^k}{k!} \right\} \prod_{\substack{d < b \\ a > b, c < d \\ a,b,c > 0; \ d > 1}} (1 - w^a x^b y^c z^d)^{-a - d - b - r - c - d - t} \]

(1.5)

\[
= \exp \left\{ \frac{z^1}{1^1} + \left(1 + \frac{w^1}{1^1}\right) \left(1 + \frac{x^1}{1^1}\right) \left(1 + \frac{y^1}{1^1}\right) \frac{z^2}{2^1} \right. \]

\[
+ \left(1 + \frac{w^1}{1^1} + \frac{w^2}{2^1}\right) \left(1 + \frac{x^1}{1^1} + \frac{x^2}{2^1}\right) \left(1 + \frac{y^1}{1^1} + \frac{y^2}{2^1}\right) \frac{z^3}{3^1} + \cdots \right\}. \]

**Corollary 1.5.** If \( |vwx|, |wxyz|, |xyz|, |yz|, \) and \( |z| < 1 \), and \( p + q + r + s + t = 1 \), then
\[
\exp \left\{ \sum_{k \geq 1} \frac{z^k}{k!} \right\} \prod_{(a, b, c, d, e) = 1 \atop \text{a, b, c, d < e}} \prod_{a, b, c, d, e > 1}^{a \text{, } b \neq c \text{, } d \neq e} \left( 1 - v^a w^b x^c y^d z^e \right)^{-a^{-p} b^{-q} c^{-r} d^{-s} e^{-t}}
\]

\[
= \exp \left\{ \frac{z}{1!} + \left( 1 + \frac{1}{1^p} \right) \left( 1 + \frac{1}{1^q} \right) \left( 1 + \frac{1}{1^r} \right) \left( 1 + \frac{1}{1^s} \right) \frac{z^2}{2!} \right.
\]
\[
+ \left( 1 + \frac{1}{1^p} \right) \left( 1 + \frac{1}{1^q} + \frac{1}{2^q} \right) \left( 1 + \frac{1}{1^r} + \frac{1}{2^r} \right) \left( 1 + \frac{1}{1^s} + \frac{1}{2^s} \right) \frac{z^3}{3!} + \cdots \right\}.
\]

(1.6)

The above results can all be proved easily when forming multiple sums derived from the logarithm of both sides, and applying the following lemma.

**Lemma 1.6.** Consider an infinite region raying out of the origin in any Euclidean vector space. The set of all lattices point vectors from the origin in that region is precisely the set of positive integer multiples of the visible point vectors (v-pv’s) in that region.

2. **Examples of the corollaries.** The simplest examples are obtained by setting \( t = 1 \) (hence, \( p, q, r, \) and \( s = 0 \)) in the above, yielding

\[
\prod_{(a, b) = 1 \atop a \neq b}^{a \text{, } b > 1} \left( 1 - y^a z^b \right)^{-b^{-1}} = \left( \frac{1 - y^z}{1 - z} \right)^{1/(1-y)},
\]

(2.1)

\[
\prod_{(a, b, c) = 1 \atop a, b < c} \left( 1 - x^a y^b z^c \right)^{-c^{-1}} = \left( \frac{1 - x z (1 - y z)}{1 - z (1 - x y z)} \right)^{1/(1-x)(1-y)},
\]

(2.2)

\[
\prod_{(a, b, c, d) = 1 \atop a, b, c < d} \left( 1 - w^a x^b y^c z^d \right)^{-d^{-1}}
\]

\[
= \left( \frac{1 - w z (1 - x z)(1 - y z)(1 - w x y z)}{(1 - z)(1 - w x z)(1 - w y z)(1 - x y z)} \right)^{1/(1-w)(1-x)(1-y)},
\]

(2.3)

\[
\prod_{(a, b, c, d, e) = 1 \atop a, b, c, d < e} \left( 1 - v^a w^b x^c y^d z^e \right)^{-e^{-1}}
\]

\[
= \left( \frac{(1 - v z)(1 - w z)(1 - x z)(1 - y z)}{(1 - z)(1 - v w z)(1 - v x z)(1 - v y z)} \right) \times \left( \frac{1 - v w y z (1 - v x y z)(1 - w x y z)}{(1 - w x z)(1 - w y z)(1 - x y z)(1 - v w x y z)} \right)^{1/(1-v)(1-w)(1-x)(1-y)}.
\]

(2.4)

These results were given in Campbell [6, 7] without the full generality of Theorem 1.1 nor of the corollaries. Particular cases of (2.1), (2.2), (2.3), and (2.4) were examined in
Campbell [9], where they were shown to have nontrivial simple cases. For example, if each of \(v, w, x,\) and \(y\) are set equal to \(z\), then the binomial coefficients appear as exponents in the right-hand sides of (2.1), (2.2), (2.3), and (2.4), and (2.4) say, becomes

\[
\prod_{(a, b, c, d, e) = 1 \atop a, b, c, d < e \atop e \geq 0} = 1_{\mu, \nu, \lambda, \kappa} = \frac{1}{(1-z)(1-z^3)(1-z^5)}^{1/(1-z)^4}.
\] (2.5)

This particular case was not given previously. The right-hand side can be easily expanded into a power series in \(z\) and the left-hand side, when expanded, enumerates weighted \(v_p v_p\) vector partitions.

### 3. A general hyperpyramid theorem.

In Campbell [7], the main theorem of the paper came from summing on all lattice points in the first hyperquadrant. In Section 1, this restricted to hyperpyramid lattices with symmetry in \(n - 1\) out of the \(n\) variables. This is evident by viewing Corollaries 1.2, 1.3, 1.4, and 1.5. If we choose to vary the shape of our hyperpyramid, the process is most easily illustrated as follows. Consider the variant of identity (1.5), where the \(x\) variable in the lattice is confined as follows:

\[
\exp \left\{ \sum_{k \geq 1} \frac{z^k}{k^t} \right\} \prod_{(a, b, c, d) = 1 \atop a, b, c > d \atop d \geq 0} = \frac{1}{(1-w x y z)^z a b c d e f} - a - b - c - d - e - f
\]

\[
= \exp \left\{ 1 + \frac{x^1}{1^t} + \frac{w^1}{1^q} \right\} \left( 1 + \frac{x^1}{1^r} + \frac{x^2}{2^r} + \frac{x^3}{3^r} \right) \left( 1 + \frac{y^1}{1^t} + \frac{y^2}{2^t} + \frac{y^3}{3^t} + \frac{y^4}{4^t} + \frac{y^5}{5^t} \right) \left( 1 + \frac{w^1}{1^q} + \frac{w^2}{2^q} \right) \left( 1 + \frac{x^1}{1^r} + \frac{x^2}{2^r} + \frac{x^3}{3^r} + \frac{x^4}{4^r} + \frac{x^5}{5^r} \right) \left( 1 + \frac{y^1}{1^t} + \frac{y^2}{2^t} + \frac{y^3}{3^t} \right) + \cdots
\]

(3.1)

It becomes clear from this that the general hyperpyramid sums can be all included in the following theorem.

**Theorem 3.1. For conditions of Theorem 1.1, and in addition for \(\alpha_i \in \mathbb{R}^+\), we have**

\[
\exp \left\{ \sum_{k \geq 1} \frac{z^k}{k^t} \right\} \prod_{(a_1, \ldots, a_n) = 1 \atop a_i, a_{i+1} \leq a_n} = \frac{1}{(1-x_1 a_1 \cdots x_n a_n)}
\]

\[
= \exp \left\{ \sum_{k \geq 1} \frac{z^k}{k^t} \right\} \prod_{k = 1}^{n-1} \left( \frac{F(k)}{j^t} \right) \frac{x_n^k}{k^b_n}, \quad \text{provided} \quad \sum_{i=1}^{n} b_i = 1,
\]

where

\[
F(k) = \begin{cases} \left\lfloor \frac{k-1}{\alpha_i} \right\rfloor & \text{if } \alpha_i > 1, \\
\left\lceil \frac{k}{\alpha_i - 1} \right\rceil & \text{if } \alpha_i < 1.
\end{cases}
\]

(3.3)
We see that this theorem counts terms on any possible hyperpyramid lattice in the first hyperquadrant, where the hyperpyramid apex is at the origin. We may allow interesting limits to apply such as the first hyperquadrant, where the hyperpyramid apex is at the origin. We may allow given in Campbell [7]. We consider only the case of theorem in a similar fashion to that of Section 2, we easily arrive at examples such as:

\[ \prod_{(a,b)=1 \atop a/11 < b \atop d \geq 0; b \geq 1} (1 - y^a z^b)^{-b-1} = \left( \frac{1 - y^{11} z}{1 - z} \right)^{1/(1-x)} \],

(3.4)

\[ \prod_{(a,b,c)=1 \atop a/5, b/7 < c \atop b \geq 0; c \geq 1} (1 - x^a y^b z^c)^{-c-1} = \left( \frac{(1 - x^5 z)(1 - y^7 z)}{(1 - z)(1 - x^5 y^7 z)} \right)^{1/(1-x)(1-y)} \],

(3.5)

\[ \prod_{(a,b,c,d)=1 \atop a/15, b/6, c/17 < d \atop a, b, c \geq 0; d \geq 1} (1 - w^a x^b y^c z^d)^{-d-1} \]

\[ = \left( \frac{(1 - w^{13} z)(1 - x^{16} z)(1 - y^{17} z)(1 - w^{13} x^{6} y^{17} z)}{(1 - z)(1 - w^{13} x^{6} z)(1 - w^{13} y^{17} z)(1 - x^{6} y^{17} z)} \right)^{1/(1-x)(1-y)} \],

(3.6)

\[ \prod_{(a,b,c,d,e)=1 \atop a/2, b/3, c/4, d/6 < e \atop a, b, c, d \geq 0; e \geq 1} (1 - v^a w^b x^c y^d z^e)^{-e-1} \]

\[ = \left( \frac{(1 - v z)(1 - w^2 z)(1 - x^3 z)(1 - y^4 z)(1 - v w^2 x^3 z)}{(1 - z)(1 - v w^2 z)(1 - v x^3 z)(1 - v y^4 z)(1 - w^2 x^3 z)} \right)^{1/(1-v)(1-w)(1-x)(1-y)} \]

\[ \times \left( \frac{(1 - v w^2 y^4 z)(1 - v x^3 y^4 z)(1 - w^2 x^3 y^4 z)}{(1 - w^2 y^4 z)(1 - x^3 y^4 z)(1 - v w^2 x^3 y^4 z)} \right)^{1/(1-v)(1-w)(1-x)(1-y)} \],

(3.7)

The analogy of (2.5) obtained from (3.7) is easily written as

\[ \prod_{(a,b,c,d,e)=1 \atop a, b, c, d \geq 0; e \geq 1} (1 - z^{a+b+c+d+e})^{-e-1} = \left( \frac{(1 - z^2)(1 - z^3)(1 - z^9)(1 - z^{10})}{(1 - z)(1 - z^6)^2(1 - z^{11})} \right)^{1/(1-z)^4} \].

(3.8)

4. Outline of the proof of Theorem 3.1. This is substantially the same method given in Campbell [7]. We consider only the case of \( n = 2 \) as it shows the method for the general case, and there is no problem in generalizing the process. We start with the sum valid for the criteria of the theorem

\[ \sum_{b \geq 1} \frac{z^b}{b^r} + \sum_{a \geq b; b \geq 2} \frac{y^a z^b}{a^b b^r} = \sum_{k=1}^{\infty} \left( \sum_{j=1}^{F(k)} \frac{y^j}{j^r} \right) \frac{z^j}{k^r}. \]
We note by illustration that this is easily seen, for \( \alpha = \frac{1}{2} \), to be
\[
\frac{z^1}{1^2} + \frac{z^2}{2^2} \left( 1 + \frac{y^1}{1^2} \right) + \frac{z^3}{3^3} \left( 1 + \frac{y^1}{1^2} \right) + \frac{z^4}{4^4} \left( 1 + \frac{y^1}{1^2} \right) + \frac{z^5}{5^5} \left( 1 + \frac{y^1}{1^2} + \frac{y^2}{2^2} \right) + \cdots, \tag{4.2}
\]
or, for \( \alpha = \frac{1}{3} \), we have (4.1) as
\[
\frac{z^1}{1^1} + \frac{z^2}{2^2} \left( 1 + \frac{y^1}{1^2} \right) + \frac{z^3}{3^3} \left( 1 + \frac{y^1}{1^2} \right) + \frac{z^4}{4^4} \left( 1 + \frac{y^1}{1^2} \right) + \frac{z^5}{5^5} \left( 1 + \frac{y^1}{1^2} + \frac{y^2}{2^2} \right) + \cdots. \tag{4.3}
\]

Let \( \lambda = s + t \). By Lemma 1.6, equation (4.1) can be written as
\[
\left( \sum_{b \geq 1} \frac{z^b}{b} \right) + \sum_{\substack{a < b \\ (a,b) = 1 \\ a \geq 1; b \geq 2}} \frac{(y^a z^b)^1}{1^1} + \frac{(y^a z^b)^2}{2^2} + \frac{(y^a z^b)^3}{3^3} + \cdots \frac{1}{a^1 b^t} \tag{4.4}
\]
\[
= -\log(1-z) + \sum_{\substack{a < b \\ (a,b) = 1 \\ a \geq 1; b \geq 2}} -\frac{1}{a^1 b^t} \log (1-y^a z^b)
\]
if and only if \( \lambda = 1 \). Exponentiating both sides of each of (4.1) and (4.2) and then equating the right-hand sides of these yield the \( n = 2 \) equivalent of Theorem 3.1. Cases of this with \( \alpha = 1 \) and \( \alpha = 1/11 \) yield (2.1) and (3.4), respectively.

Special Issue on
Singular Boundary Value Problems for Ordinary Differential Equations

Call for Papers

The purpose of this special issue is to study singular boundary value problems arising in differential equations and dynamical systems. Survey articles dealing with interactions between different fields, applications, and approaches of boundary value problems and singular problems are welcome.

This Special Issue will focus on any type of singularities that appear in the study of boundary value problems. It includes:

- Theory and methods
- Mathematical Models
- Engineering applications
- Biological applications
- Medical Applications
- Finance applications
- Numerical and simulation applications

Before submission authors should carefully read over the journal’s Author Guidelines, which are located at http://www.hindawi.com/journals/bvp/guidelines.html. Authors should follow the Boundary Value Problems manuscript format described at the journal site http://www.hindawi.com/journals/bvp/. Articles published in this Special Issue shall be subject to a reduced Article Processing Charge of €200 per article. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
