PROPERTIES OF SOLUTIONS OF QUATERNIONIC RICCATI EQUATIONS

GEVORG AVAGOVICH GRIGORIAN

ABSTRACT. In this paper we study properties of regular solutions of quaternionic Riccati equations. The obtained results we use for study of the asymptotic behavior of solutions of two first-order linear quaternionic ordinary differential equations.

1. INTRODUCTION

Let \( a(t), b(t), c(t) \) and \( d(t) \) be quaternionic-valued continuous functions on \([t_0, +\infty)\), i.e.: \( a(t) \equiv a_0(t) + i a_1(t) + j a_2(t) + k a_3(t), b(t) \equiv b_0(t) + i b_1(t) + j b_2(t) + k b_3(t), c(t) \equiv c_0(t) + i c_1(t) + j c_2(t) + k c_3(t), d(t) \equiv d_0(t) + i d_1(t) + j d_2(t) + k d_3(t) \), where \( a_n(t), b_n(t), c_n(t), d_n(t) \) \((n = 0, 3)\) are real-valued continuous functions on \([t_0, +\infty)\), \(i, j, k\) are the imaginary unities satisfying the conditions
\[
(1.1) \quad i^2 = j^2 = k^2 = ijk = -1, \quad ij = -ji = k.
\]

Consider the quaternionic Riccati equation
\[
(1.2) \quad q' + qa(t)q + b(t)q + qc(t) + d(t) = 0, \quad t \geq t_0.
\]

Particular cases of this equation appear in various problems of mathematics, in particular in problems of mathematical physics (e.g., in the Euler’s vorticity dynamics \([13]\), in the Euler’s fluid dynamics \([4]\), in the problem of classification of diffeomorphisms of \(S^1\) \([14]\), and in the other ones \([2, 12]\)). A quaternionic-valued function \( q = q(t), \) defined on \([t_1, t_2]) \((t_0 \leq t_1 < t_2 \leq +\infty)\) is called a solution of Eq. \((1.2)\) on \([t_1, t_2])\), if it is continuously differentiable on \([t_1, t_2])\) and satisfies \((1.2)\) on \([t_1, t_2]).\)

It follows from the general theory of ordinary differential equations that for every \( t_1 \geq t_0 \) and \( \gamma \in \mathbb{H} \) (here and after \( \mathbb{H} \) denotes the algebra of quaternions) there exists \( t_2 > t_1 \) \((t_2 \leq +\infty)\) such that Eq. \((1.2)\) has the unique solution \( q(t) \) on \([t_1, t_2]),\) satisfying the initial condition \( q(t_1) = \gamma.\) Thus for every \( t_1 \geq t_0 \) and \( \gamma \in \mathbb{H} \) a solution \( q(t) \) of Eq. \((1.2)\) with \( q(t_1) = \gamma \) exists or else on some finite interval \([t_1, t_2])\) or else on \([t_1, +\infty)).\) In the last case the solution \( q(t) \) we will call a \( t_1\)-regular (or simply regular) solution of Eq. \((1.2).\) Notice that some sufficient conditions

\[2020 \text{ Mathematics Subject Classification: primary 34L30; secondary 34C99.}\]

\textbf{Key words and phrases:} quaternions, the matrix representation of quaternions, quaternionic Riccati equations, regular, normal and extremal solutions of Riccati equations, normal, irreconcilable, sub extremal and super extremal systems, principal and non principal solutions.

for existence of regular solutions are obtained in the works [11,11,13]. In the real case properties of regular solutions of Eq. (1.2) are studied in [6] and have found several applications (see [7]–[10]). In this paper we study the properties of regular solutions of Eq. (1.2). We use the obtained result to study the asymptotic behavior of solutions of systems of two first-order linear quaternionic differential equations.

2. Auxiliary propositions

It is not difficult to verify that there exists a one to one correspondence $q \mapsto Q$ between the quaternions $q = q_0 + iq_1 + jq_2 + kq_3$, $q_k \in \mathbb{R}$, $k = 0,3$ and the skew symmetric matrices

$$Q \equiv \begin{pmatrix} q_0 & q_1 & q_2 & -q_3 \\ -q_1 & q_0 & -q_3 & -q_2 \\ -q_2 & q_3 & q_0 & q_1 \\ q_3 & q_2 & -q_1 & q_0 \end{pmatrix},$$

keeping the arithmetic operations: $q_m \mapsto Q_m$, $m = 1,2 \Rightarrow q_1 + q_2 \mapsto Q_1 + Q_2, q_1q_2 = Q_1Q_2, q_1^{-1} = Q_1^{-1}$ $(q_1 \neq 0)$. The matrix $Q$ we will call the symbol of $q$ and will denote by $\hat{q}$. By $|q|$ we denote the euclidean norm of the vector $q$: $|q| \equiv \sqrt{q_0^2 + q_1^2 + q_2^2 + q_3^2}$. We also denote $Re\, q \equiv q_0$ – the real part of $q$ and $Im\, q \equiv iq_1 + jq_2 + kq_3$ – the imaginary part of $q$. Finally by $tr\, \hat{q}$ we denote the trace of $\hat{q}$.

**Lemma 2.1.** For every quaternion $q$ the equalities

$$\det \hat{q} = |q|^4, \quad tr \hat{q} = 4 Re\, q$$

are valid.

**Proof.** By direct checking.

Let $A(t), B(t), C(t)$ and $D(t)$ be the symbols of $a(t), b(t), c(t)$ and $d(t)$ respectively. Consider the matrix Riccati equation

$$(2.1) \quad Y' + YA(t)Y + B(t)Y + YC(t) + D(t) = 0, \quad t \geq t_0.$$ 

Obviously the solutions $q(t)$ of Eq. (1.2), existing on an interval $[t_1, t_2)$ ($t_0 \leq t_1 < t_2 \leq + \infty$) are connected with solutions $Y(t)$ of Eq. (2.1) by relation

$$(2.2) \quad \widehat{q(t)} = Y(t), \quad t \in [t_1, t_2).$$

Let $Y(t)$ be a solution of Eq. (2.1) on $[t_1, t_2)$. Then every solution $Y_1(t)$ of Eq. (2.1) on $[t_1, t_2)$ is connected with $Y(t)$ by the formula (see [3], pp. 139, 140, 158, 159, Theorem 6.2)

$$Y_1(t) = Y(t) + [\Phi_Y(t)A^{-1}(t_1)(I + A(t_1)M_Y(t_1, t))\Psi_Y(t)]^{-1}, \quad t \in [t_1, t_2),$$

where $\Phi_Y(t)$ and $\Psi_Y(t)$ are the solutions of the linear matrix equations

$$\Phi' = [A(t)Y(t) + C(t)]\Phi, \quad t \in [t_1,t_2),$$

$$\Psi' = \Psi[B(t) + Y(t)A(t)], \quad t \in [t_1,t_2),$$

$$\Phi_Y(t_1) = \Phi_Y(t), \quad \Psi_Y(t_1) = \Psi_Y(t).$$
respectively with $\Phi_Y(t_1) = \Psi_Y(t_1) = I$, $I$ is the identity matrix of dimension $4 \times 4$, $\lambda(t_1) \equiv Y_1(t_1) - Y(t_1)$, provided $\det \lambda(t_1) \neq 0$. From here we obtain

\begin{equation}
(2.3) \quad Y_1(t) = Y(t) + \Psi_Y^{-1}(t)[I + \lambda(t_1)\mathcal{M}_Y(t_1, t)]^{-1}\lambda(t_1)\Phi_Y^{-1}(t), \quad t \in [t_1, t_2).
\end{equation}

By the Liouville formula we have:

\begin{equation}
(2.4) \quad \det \Phi_Y(t) = \exp \left\{ \int_{t_1}^{t} \text{tr} \left[ A(\tau)Y(\tau) + C(\tau) \right] d\tau \right\}, \quad t \in [t_1, t_2),
\end{equation}

\begin{equation}
(2.5) \quad \det \Psi_Y(t) = \exp \left\{ \int_{t_1}^{t} \text{tr} \left[ A(\tau)Y(\tau) + B(\tau) \right] d\tau \right\}, \quad t \in [t_1, t_2),
\end{equation}

Let $q(t)$ be a solution of Eq. (1.2) on $[t_1, t_2)$. Then due to (2.2) from (2.3) it follows that for every solution $q_1(t)$ of Eq. (1.2) on $[t_1, t_2)$ the equality

\begin{equation}
(2.6) \quad q_1(t) = q(t) + \psi_q^{-1}(t)[1 + \lambda(t_1)\mu_q(t_1; t)]^{-1}\lambda(t_1)\phi_q^{-1}(t), \quad t \in [t_1, t_2)
\end{equation}

is valid, where $\phi_q(t)$ and $\psi_q(t)$ are the solutions of the linear equations

\begin{align*}
\phi' &= [a(t)q(t) + c(t)]\phi, \quad t \in [t_1, t_2), \\
\psi' &= \psi[b(t) + q(t)a(t)], \quad t \in [t_1, t_2),
\end{align*}

respectively with $\phi_q(t_1) = \psi_q(t_1) = 1$, $\lambda(t_1) \equiv q_1(t_1) - q(t_1)$,

\begin{equation}
(2.7) \quad |\phi_q(t)| = \exp \left\{ \int_{t_1}^{t} \Re [a(\tau)q(\tau) + c(\tau)] d\tau \right\}, \quad t \in [t_1, t_2),
\end{equation}

\begin{equation}
(2.8) \quad |\psi_q(t)| = \exp \left\{ \int_{t_1}^{t} \Re [a(\tau)q(\tau) + b(\tau)] d\tau \right\}, \quad t \in [t_1, t_2).
\end{equation}

Let $q_m(t), \ m = 1, 2$ be solutions of Eq. (1.2) on $[t_1, t_2)$. Set: $\lambda_{m,s}(t_1) \equiv q_m(t_1) - q_s(t_1), \ m, s = 1, 2$. By (2.4) we have

\begin{equation}
a(t)[q_m(t) - q_s(t)] = a(t)\psi_q^{-1}(t)[1 + \lambda_{m,s}(t_1)\mu_q(t_1; t)]^{-1}\phi_q^{-1}(t), \quad t \in [t_1, t_2).
\end{equation}

Hence,

\begin{equation}
[1 + \lambda_{m,s}(t_1)\mu_q(t_1; t)]' = A_{q_m,q_s}(t_1; t)[1 + \lambda_{m,s}(t_1)\mu_q(t_1; t)], \quad t \in [t_1, t_2),
\end{equation}
where
\[ A_{m,s}(t_1;t) = \lambda_{m,s}(t_1)\psi_{q_1}^{-1}(t)\left[q_m(t) - q_s(t)\right]\phi_{q_1}^{-1}(t)\lambda_{m,s}(t_1), \quad t \in [t_1, t_2], \quad m = 1, 2. \]

From here it follows
\[ [I + \lambda_{m,s}(t_1)\mu_{q_1}(t_1; t)] = A_{m,s}(t_1; t)[I + \lambda_{m,s}(t_1)\mu_{q_1}(t_1; t)], \quad t \in [t_1, t_2], \quad m = 1, 2. \]

By Lemma \[2.1\] and the Liouville’s formula from here we obtain
\[ (2.9) \quad |1 + \lambda_{m,s}(t_1)\mu_{q_1}(t_1; t)| = \exp \left\{ \int_{t_1}^{t} \mathbb{R} \left[a(\tau)(q_m(\tau) - q_s(\tau))\right] d\tau \right\}, \quad t \in [t_1, t_2), \quad m, s = 1, 2. \]

From here we immediately get:
\[ (2.10) \quad |1 + \lambda_{m,s}(t_1)\mu_{q_1}(t_1; t)| = 1, \quad t \in [t_1, t_2), \quad m, s = 1, 2. \]

\[ \square \]

3. Properties of regular solutions of Eq. \[1.2\]

**Definition 3.1.** A \( t_1 \)-regular solution \( q(t) \) of Eq. \[1.2\] is called \( t_1 \)-normal if there exists a neighborhood \( U(q(t_1)) \) of \( q(t_1) \) such that every solution \( \tilde{q}(t) \) of Eq. \[1.2\] with \( \tilde{q}(t_1) \in U(q(t_1)) \) is also \( t_1 \)-regular, otherwise \( q(t) \) is called \( t_1 \)-extremal.

**Definition 3.2.** Eq. \[1.2\] is called regular if it has at least one regular solution.

**Remark 3.1.** Since the solutions of Eq. \[1.2\] are continuously dependent on their initial values every \( t_1 \)-normal (\( t_1 \)-extremal) solution of Eq. \[1.2\] is also a \( t_2 \)-normal (\( t_2 \)-extremal) solution of Eq. \[1.2\] for all \( t_2 > t_1 \). Due to this a \( t_1 \)-normal (\( t_1 \)-extremal) solution of Eq. \[1.2\] we will just call a normal (a extremal) solution of Eq. \[1.2\]. Note that a \( t_2 \)-normal (\( t_2 \)-extremal) solution of Eq. \[1.2\] may not be a \( t_1 \)-normal (\( t_1 \)-extremal) solution of Eq. \[1.2\] if \( t_1 < t_2 \), because a \( t_2 \)-regular solution of Eq. \[1.2\] may not be \( t_1 \)-regular for \( t_1 < t_2 \).

**Theorem 3.1.** If Eq. \[1.2\] has a \( t_1 \)-regular solution \( q(t) \) for some \( t_1 \geq t_0 \), then it has also another (different from \( q(t) \)) \( t_1 \)-regular solution.

**Proof.** Let \( q(t) \) be a \( t_1 \)-regular solution for some \( t_1 \geq t_0 \). Since \( \mu_q(t_1; t) \) is continuously differentiable by \( t \) there exists \( \gamma \in \mathbb{H}\{0\} \) such that \( \mu_q(t_1; t) \neq \gamma \) for all \( t \geq t_0 \) \( (\mu_q(t_1; t) = 0 \) and the curve \( f(t) \equiv \mu_q(t_1; t), \quad t \geq t_1 \) is not space filling). Therefore by \[2.7\] the solution \( q_1(t) \) of Eq. \[1.2\] with \( q_1(t_1) = q(t_1) - \frac{1}{\gamma} \) is a \( t_1 \)-regular solution of Eq. \[1.2\], different from \( q(t) \). The theorem is proved. \[ \square \]

Denote by \( Q(t; t_1; \lambda) \) the general solution of Eq. \[1.2\] in the region \( G_{t_1} \equiv \{(t; q) : t \in I_{t_1}(\lambda), q, \lambda \in \mathbb{H}\} \), where \( I_{t_1} \) is the maximum existence interval for the solution \( q(t) \) of Eq. \[1.2\] with \( q(t_1) = \lambda \).

**Example 3.1.** Consider the equation
\[ (3.1) \quad q' + qa(t)q = 0, \quad t \geq -1. \]
The general solution of this equation in the region \( G_0 \cap [-1, +\infty) \times \mathbb{H} \) is given by formula

\[
(3.2) \quad Q(t; 0; \lambda) = \frac{1}{1 + \lambda \int_{t_1}^t a(\tau)d\tau} \lambda, \quad \lambda \in \mathbb{H}, \quad 1 + \lambda \int_{t_1}^t a(\tau)d\tau \neq 0, \quad t \geq t_1.
\]

Assume \( a(t) \) has a bounded support. Then from (3.2) it is seen that Eq. (3.1) has no 0-extremal solution, and all its solutions \( Q(t_1; 0; \lambda) \) with enough small \( |\lambda| \) are 0-normal. If \( a(t) \) is a non-negative function with an unbounded support and \( I_0 = \int_0^t a(\tau)d\tau \equiv +\infty \) then from (3.2) it is seen that the solution \( q_0(t) = Q(t; 0; -\frac{1}{I_0}) \) is 0-extremal; all the solutions \( Q(t; 0; \lambda) \) with \( \lambda \in \mathbb{H}\setminus\{0\} \) are 0-normal and all the solutions \( Q(t; 0; \lambda) \) with \( \lambda \in (-\infty, -\frac{1}{I_0}) \) are not 0-regular. Assume now that \( q(t) = \int_0^t a(\tau)d\tau = \arctan(\cos t + i \sin t + j \cos \pi t + k \sin \pi t), \) \( t \geq 0 \). Then from (3.2) it is seen that all the solutions \( Q(t; 0; \lambda) \) with \( |\lambda| = \frac{\sqrt{2}}{\pi} \) are 0-extremal (since the set \( \{\frac{1}{\sqrt{2}}(\cos t + i \sin t + j \cos \pi t + k \sin \pi t) : t \geq 0\} \) is everywhere dense in the unite sphere \( \{q : |q| = 1\} \) and all solutions \( Q(t; 0; \lambda) \) with \( |\lambda| < \frac{\sqrt{2}}{\pi} \) are 0-normal.

**Example 3.2.** For \( u_0 \in \mathbb{H} \) and \( 0 < r < R < +\infty \) denote \( K_{r,R}(u_0) \equiv \{q \in \mathbb{H} : r < |q - u_0| < R\} \) - an annulus in \( \mathbb{H} \) with a center \( u_0 \) and radiuses \( r \) and \( R \). For any \( \varepsilon > 0 \) denote \( K_{\varepsilon,r,R}(u_0) \equiv \{\xi_1, \ldots, \xi_m \in K_{r,R}(u_0) : \) if \( u \in K_{r,R}(u_0) \) then there exists \( s \in \{1, \ldots, m\} \) such that \( |u - \xi_s| < \varepsilon\} \) - a finite \( \varepsilon \)-net for \( K_{r,R}(u_0) \) (here \( m \) depends on \( \varepsilon \)). Consider the sequence of \( \frac{1}{2n} \)-nets: \( \{K_{\frac{1}{2n}, \frac{1}{n}, n}(u_0)\}_{n=1}^{+\infty} \). Let the function \( f(t) \equiv \int_0^t a(\tau)d\tau, \) \( t \geq 0 \) has the following properties: \( f(t) \neq u_0, t \in [0, 1]; \) when \( t \) varies from \( n \) to \( n + 1 \) \( (n = 1, 2, \ldots) \) the curve \( f(t) \) crosses all points of \( K_{\frac{1}{2n}, \frac{1}{n}, n}(u_0) \) (i.e. for every \( v \in K_{\frac{1}{2n}, \frac{1}{n}, n}(u_0) \) there exists \( \xi_v \in [n, n + 1] \) such that \( f(\xi_v) = v\); \( f(t) \in K_{\frac{1}{2n}, +\infty}(u_0), \) \( n = 1, 2, \ldots, t \geq 1 \). From these properties it follows that for every \( T \geq 0 \) the set \( \{f(t) : t \geq T\} \) is everywhere dense in \( \mathbb{H} \) and \( f(t) \neq u_0, t \geq 0 \). Hence from (3.2) it follows that Eq. (3.1) has no \( t_1 \)-normal solutions for all \( t_1 \geq 0 \) and has at least two extremal solutions: \( q_1(t) \equiv 0 \) and \( q_2(t) \) with \( q_2(0) = -\frac{1}{u_0} \). By analogy using \( \frac{1}{2n} \)-nets \( \{K_{\frac{1}{2n}, \frac{1}{n}, n}(u_0; \ldots ; u_l) = \{\xi_1, \ldots, \xi_m \in \bigcap_{k=0}^l K_{\frac{1}{n}, n}(u_k) : u \in \bigcap_{k=0}^l K_{\frac{1}{n}, n}(u_k) \Rightarrow \exists s \in \{1, \ldots, m\} : |u - \xi_s| < \frac{1}{2n}\} \) of the intersections \( \bigcap_{k=0}^l K_{\frac{1}{n}, n}(u_k) \) in place of \( K_{\frac{1}{2n}, \frac{1}{n}, n}(u_0), \) \( n = 1, 2, \ldots \) one can show that there exists a Riccati equation which has no \( t_1 \)-normal solutions and has at least \( l + 2 \) \( t_1 \)-extremal solutions for all \( t_1 \geq 0 \).

**Theorem 3.2.** A \( t_1 \)-regular solution \( q(t) \) of Eq. (1.2) is \( t_1 \)-normal if and only if \( \mu_q(t_1; t) \) is bounded by \( t \).
**Proof.** Sufficiency. Set \( M = \sup_{t \geq t_1} |\mu_q(t_1,t; t)|. \) Let \( q_1(t) \) be a solution of Eq. (1.2) with \( |q(t_1) - q_1(t_1)| < \frac{M}{2}. \) Then obviously
\[
1 + (q_1(t_1) - q(t_1))\mu_q(t_1; t) \neq 0, \quad t \geq t_1.
\]
By (2.7) from here it follows that \( q_1(t) \) is \( t_1 \)-normal.

Necessity. Suppose \( \mu_q(t_1; t) \) is unbounded by \( t \) on \([t_1, +\infty)\). Let then \( t_1 < t_2 < \cdots < t_m, \ldots \) be an infinitely large sequence such that
\[
(3.3) \quad |\mu_q(t_1; t_n)| \geq n, \quad n = 2, 3, \ldots
\]
Let \( q_n(t), n = 2, 3, \ldots \) be the solutions of Eq. (1.2) with
\[
(3.4) \quad q_n(t_1) - q(t_1) = -\mu_q(t_1; t_n)^{-1}, \quad n = 2, 3, \ldots
\]
Since \( q(t) \) is \( t_1 \)-normal there exists \( \delta > 0 \) such that every solution \( \tilde{q}(t) \) of Eq. (1.2) with \( |\tilde{q}(t_1) - q(t_1)| < \delta \) is \( t_1 \)-regular. Hence from (3.3) and (3.4) it follows that for enough large \( n \) the solutions \( q_n(t) \) are \( t_1 \)-regular. On the other hand by (2.7) from (3.4) it follows that for enough large \( n \) every solution \( q_n(t) \) is unbounded in the neighborhood of \( t_n \). It means that for enough large \( n \) the solutions \( q_n(t) \) are not \( t_1 \)-regular. The obtained contradiction completes the proof of the theorem. \( \square \)

By (2.9) from Theorem 3.2 we immediately obtain

**Corollary 3.1.** The following statements are valid:
1) any two \( t_1 \)-regular solutions \( q_1(t) \) and \( q_2(t) \) of Eq. (1.2) are \( t_1 \)-normal if and only if the function
\[
I_{q_1, q_2}(t) \equiv \int_{t_1}^{t} \text{Re} [a(\tau)(q_1(\tau) - q_2(\tau))]d\tau, \quad t \geq t_1
\]
is bounded;

2) if \( q_N(t) \) and \( q_*(t) \) are \( t_1 \)-normal and \( t_1 \)-extremal solutions of Eq. (1.2), respectively, then
\[
\limsup_{t \to +\infty} \int_{t_1}^{t} \text{Re} [a(\tau)(q_*(\tau) - q_N(\tau))]d\tau < +\infty,
\]
\[
\liminf_{t \to +\infty} \int_{t_1}^{t} \text{Re} [a(\tau)(q_*(\tau) - q_N(\tau))]d\tau = -\infty;
\]

3) if \( q_*(t) \) and \( q^*(t) \) are \( t_1 \)-extremal solutions of Eq. (1.2) then
\[
\limsup_{t \to +\infty} \int_{t_1}^{t} \text{Re} [a(\tau)(q_*(\tau) - q^*(\tau))]d\tau = +\infty,
\]
\[
\liminf_{t \to +\infty} \int_{t_1}^{t} \text{Re} [a(\tau)(q_*(\tau) - q^*(\tau))]d\tau = -\infty.
\]

**Definition 3.3.** A regular Eq. (1.2) is called normal if it has no extremal solutions.
Definition 3.4. A regular Eq. (1.2) is called irreconcilable if its every regular solution is extremal.

Definition 3.5. A regular Eq. (1.2) is called sub extremal if it has only one extremal solution.

Definition 3.6. A regular Eq. (1.2) is called super extremal if it has at least two extremal solutions and normal solutions.

From Definitions 3.3 - 3.6 is seen that every regular Eq. (1.2) is or else normal or else irreconcilable or else sub extremal or else super extremal. The examples, illustrated above, show that all these types of equations exist.

For any \( t_1 \)-regular solution \( q(t) \) of Eq. (1.2) set
\[
\nu_q(t) = \int_{t}^{+\infty} \phi_q^{-1}(\tau)a(\tau)\psi_q^{-1}(\tau)d\tau, \quad t \geq t_1,
\]
where \( \phi_q(t) \) and \( \psi_q(t) \) are the solutions of the linear equations
\[
\phi' = [a(t)q(t) + c(t)]\phi, \quad t \geq t_1.
\]
\[
\psi' = \psi[b(t) + q(t)a(t)], \quad t \geq t_1,
\]
respectively with \( \phi_q(t_1) = \psi_q(t_1) = 1 \).

Theorem 3.3. Let \( q_0(t) \) be a \( t_1 \)-regular solution of Eq. (1.2) such that the integral \( \nu_{q_0}(t_1) \) is convergent. Then in order that Eq. (1.2) has a \( t_1 \)-extremal solution it is necessary and sufficient that \( \nu_{q_0}(t) \neq 0, \quad t \geq t_1 \). If this condition is satisfied then:

1) the unique \( t_1 \)-extremal solution \( q_\ast(t) \) of Eq. (1.2) is given by the formula
\[
q_\ast(t) = q_0(t) - \frac{1}{\nu_{q_0}(t)}, \quad t \geq t_1,
\]
where \( \nu_{q_0}(t) \equiv \phi_q(t)\nu_{q_0}(t)\psi_q(t) \);

2) for all \( t_1 \)-normal solutions \( q(t) \) of Eq. (1.2) and only for them the integrals \( \nu_q(t) \) converge for all \( t \geq t_1 \) and \( \nu_q(t) \neq 0, \quad t \geq t_1 \);

3) for all \( t \geq t_1 \)
\[
\nu_{q_\ast}(t) = \infty;
\]

4) for two arbitrary \( t_1 \)-normal solutions \( q_1(t) \) and \( q_2(t) \) the integral
\[
\int_{t_1}^{+\infty} \text{Re} \left[ a(\tau)(q_1(\tau) - q_2(\tau)) \right] d\tau
\]
converges;

5) for every \( t_1 \)-normal solution \( q_N(t) \) of Eq. (1.2) the equality
\[
\int_{t_1}^{+\infty} \text{Re} \left[ a(\tau)(q_\ast(\tau) - q_N(\tau)) \right] d\tau = -\infty
\]
is valid.
Proof. Let \( q_0(t) \) be a \( t_1 \)-regular solution of Eq. (1.2) for which \( \nu_{q_0}(t_1) \) converges and \( \nu_{q_0}(t) \neq 0 \) \( t \geq t_1 \). Then

\begin{equation}
1 - \frac{1}{\nu_{q_0}(t_1)} \mu_{q_0}(t_1; t) \neq 0, \quad t \geq t_1.
\end{equation}

Indeed otherwise if for some \( t_2 > t_1 \) \( \nu_{q_0} = \mu_{q_0}(t_1; t_2) \) then from the equality \( \nu_{q_0}(t) = \mu_{q_0}(t_1; t_2) + \nu_{q_0}(t_2) \) it follows that \( \nu_{q_0}(t_2) = 0 \), which contradicts our assumption. Let \( q_*(t) \) be the solution of Eq. (1.2) with \( q_*(t_1) = q_0(t_1) - \frac{1}{\nu_{q_0}(t_1)} \). Then by (2.7) from (3.8) it follows that \( q_*(t) \) is \( t_1 \)-regular and according to (2.10) we have

\[ \left| 1 + \frac{1}{\nu_{q_*}(t_1)} \mu_{q_*}(t_1; t) \right| \left| 1 - \frac{1}{\nu_{q_0}(t_1)} \mu_{q_0}(t_1; t) \right| \equiv 1, \quad t \geq t_1. \]

From here it follows \( \nu_{q_*}(t_1) = \lim_{t \to +\infty} \mu_{q_*}(t_1; t) = \infty \). Then by virtue of Theorem 3.2 \( q_* \) is \( t_1 \)-extremal and (3.6) is valid. Assume now Eq. (1.2) has a \( t_1 \)-extremal solution \( q_*(t) \). Show that \( \nu_{q_0}(t) \neq 0 \), \( t \geq t_1 \). Suppose for some \( t_2 \geq t_1 \) \( \nu_{q_0}(t_2) = 0 \). Then obviously

\begin{equation}
\lim_{t \to +\infty} \left[ 1 + (q_*(t_2) - q_0(t_2)) \mu_{q_0}(t_2; t) \right] = 1.
\end{equation}

By (2.10) we have

\[ \left| 1 + (q_0(t_2) - q_*(t_2)) \mu_{q_*}(t_2; t) \right| \left| 1 + (q_* (t_2) - q_0(t_2)) \mu_{q_0}(t_2; t) \right| \equiv 1, \quad t \geq t_2. \]

This together with (3.9) implies that \( \mu_{q_*}(t_2; t) \) is bounded by \( t \) on \([t_2, +\infty)\). Therefore \( \mu_{q_*}(t_1; t) \) is bounded by \( t \) on \([t_1, +\infty)\), and according to Theorem 3.2 \( q_* \) is \( t_1 \)-normal, which contradicts our assumption. The obtained contradiction shows that \( \nu_{q_0}(t) \neq 0 \), \( t \geq t_1 \). Let us prove (3.5). By (2.7) we have

\begin{equation}
q_*(t) = q_0(t) + \left[ \phi_q(t) \left[ \lambda(t_1)^{-1} + \mu_{q_0}(t_1, t) \psi_q(t) \right] \right]^{-1}, \quad t \geq t - 1,
\end{equation}

where \( \lambda(t_1) = q_*(t_1) - q_0(t_1) \). Since \( q_*(t_1) - \frac{1}{\nu_{q_0}(t_1)} \) from her and from (3.10) we obtain (3.5).

Let \( q(t) \) be a \( t_1 \)-normal solution of Eq. (1.2). By (2.10) we have

\[ \left| 1 + (q(t_1) - q_*(t_1)) \mu_{q_*}(t_1; t) \right| \left| 1 + (q_* (t_1) - q(t_1)) \mu_{q_1}(t_1; t) \right| \equiv 1, \quad t \geq t_1. \]

This together with (3.6) implies

\[ \lim_{t \to +\infty} \left[ 1 + (q_*(t_1) - q(t_1)) \mu_q(t_1; t) \right] = 0. \]

Therefore the integrals \( \nu_q(t) \) converge for all \( t \geq t_1 \). The inequality \( \nu_q(t) \neq 0 \), \( t \geq t_1 \) follows immediately from the already proven necessary condition of existence of a \( t_1 \)-extremal solution of Eq. (1.2).

Let \( q_1(t) \) and \( q_2(t) \) be \( t_1 \)-normal solutions of Eq. (1.2). By (2.9) we have

\[ \left| 1 + (q_1(t_1) - q_2(t_1)) \mu_{q_2}(t_1; t) \right| = \exp \left\{ \int_{t_1}^{t} \text{Re} \left[ a(\tau)(q_1(\tau) - q_2(\tau)) \right] d\tau \right\}, \quad t \geq t_1. \]
Then the statements where
\[ \alpha \]  
(3.12)

Example 3.3. Eq. (1.2) is called extremal if for some
Definition 3.8.

of Eq. (1.2). Then by Theorem 3.3
Eq. (1.2), different from
it follows that

From here and from (3.11) it follows that
Proof.

Let Eq. (1.2) be a quaternionic valued continuously differentiable
function on
q
such that
(3.11)

\[ |1 + (q_1(t_N) - q_*(t_1))\mu_*(t_1; t)| = \exp \left\{ \int_{t_1}^{t} \Re \left[a(\tau)(q_*(\tau) - q_N(\tau))\right] d\tau \right\}, \quad t \geq t_1. \]

This together with (3.6) implies (3.7). The theorem is proved. \( \Box \)

Corollary 3.2. Let Eq. (1.2) have a \( t_1 \)-regular solution \( q_*(t) \) such that \( \nu_{q_*(t_1)} = \infty \). Then the statements 1) - 5) of Theorem 3.3 are valid.

Proof. By Theorem 3.3 it is enough to show that Eq. (1.2) has a \( t_1 \)-regular solution \( q_0(t) \) such that \( \nu_{q_0(t_1)} \) converges and \( \nu_{q_0(t)} \neq 0, \ t \geq t_1 \). Let \( q_0(t) \) be a \( t_1 \)-regular solution of Eq. (1.2), different from \( q_*(t) \). In virtue of (2.10) we have

\[ |1 + (q_0(t_1) - q_*(t_1))\mu_*(t_1; t)|; |1 + (q_*(t_1) - q_0(t_1))\mu_{q_0}(t_1; t)| \equiv 1, \quad t \geq t_1. \]

From the condition of the corollary it follows that

\[ \lim_{t \to +\infty} |1 + (q_0(t_1) - q_*(t_1))\mu_*(t_1; t)| = +\infty. \]

From here and from (3.11) it follows that \( q_0(t) \) is \( t_1 \)-normal and the integral \( \nu_{q_0(t_1)} \) converges. Moreover by virtue of Theorem 3.2 from the condition of the corollary it follows that \( q_*(t) \) is \( t_1 \)-extremal. Since \( q_0(t) \) is an arbitrary \( t_1 \)-regular solution of Eq. (1.2), different from \( q_*(t) \) it follows that \( q_*(t) \) is the unique \( t_1 \)-extremal solution of Eq. (1.2). Then by Theorem 3.3 \( \nu_{q_0(t)} \neq 0, \ t \geq t_1 \). The corollary is proved. \( \Box \)

Theorem 3.3 and Corollary 3.2 allow us to give the following equivalent definitions.

Definition 3.7. Eq. (1.2) is called extremal if for some \( t_1 \geq t_0 \) it has a \( t_1 \)-regular solution \( q(t) \) such that \( \nu_q(t_1) \) converges and \( \nu_q(t) \neq 0, \ t \geq t_1 \).

Definition 3.8. Eq. (1.2) is called extremal if for some \( t_1 \geq t_0 \) it has a \( t_1 \)-regular solution \( q(t) \) such that \( \nu_q(t_1) = \infty \).

Example 3.3. Let \( \lambda(t) \) be a quaternionic valued continuously differentiable function on \( [t_0, +\infty) \), \( \alpha(t) = \alpha_0(t) + i\alpha_1(t), \beta(t) = \beta_0(t) + j\beta_1(t), \ t \geq t_0 \), where \( \alpha_0(t), \ \alpha_1(t), \ \beta_0(t) \) and \( \beta_1(t) \) are some real-valued continuous functions on \( [t_0, +\infty) \). Consider the Riccati equation

\[ q' + qa(t)q - [\lambda(t)a(t) + \alpha(t)]q - q[a(t)\lambda(t) + \beta(t)] - \lambda'(t) + \lambda(t)a(t)\lambda(t) + \alpha(t)\lambda(t) + \lambda(t)\beta(t) = 0, \quad t \geq t_0. \]
It is not difficult to verify that \( q = \lambda(t) \) is a \( t_0 \)-regular solution of this equation and

\[
\phi_\lambda(t) = \exp\left\{ -\int_{t_0}^{t} \beta(\tau) \, d\tau \right\}, \quad \psi_\lambda(t) = \exp\left\{ -\int_{t_0}^{t} \alpha(\tau) \, d\tau \right\}, \quad t \geq t_0.
\]

So

\[
\nu_\lambda(t) = \int_{t_0}^{+\infty} \exp\left\{ \int_{t_0}^{\tau} \beta(s) \, a(\tau) \, d\tau \right\} \, d\tau, \quad t \geq t_0.
\]

Therefore if \( \nu_\lambda(t_0) \) converges and \( \nu_\lambda(t) \neq 0 \), \( t \geq t_1 \) for some \( t_1 \geq t_0 \) or if \( \nu_\lambda(t_0) = \infty \), then Eq. (3.12) is extremal. If \( \nu_\lambda(t_0) \) converges and \( \nu_\lambda(t) \) has arbitrary large zeroes, then Eq. (1.2) is normal.

Obviously every extremal Eq. (1.2) is sub extremal. The next example shows that not all sub extremal equations are extremal.

**Example 3.4.** Consider the Riccati equation

\[
(3.13) \quad q' + q(t \cos t)q = 0, \quad t \geq t_0, \quad t_0 \sin t_0 + \cos t_0 = 0.
\]

For every \( \lambda \in \mathbb{H} \) the solution \( q(t) \) of this equation with \( q(t_0) = \lambda \) has the form

\[
q(t) = \frac{1}{1 + \lambda(t \sin t + \cos t)} \lambda, \quad 1 + \lambda(t \sin t + \cos t) \neq 0.
\]

Hence every solution \( q(t) \) of this equation with \( q(t_0) \in \mathbb{H} \setminus (\mathbb{R} \setminus \{0\}) \) is \( t_0 \)-regular and for \( q(t_0) \in \mathbb{R} \setminus \{0\} \) \( q(t) \) is not \( t_0 \)-regular. Therefore \( q_0(t) \equiv 0 \) is a \( t_0 \)-extremal solution of Eq. (3.13) and all its solutions \( q(t) \) with \( q(t_0) \in \mathbb{H} \setminus \mathbb{R} \) are \( t_0 \)-normal. From here it follows that Eq. (3.13) is sub extremal. Obviously the integral

\[
\nu_{q_0}(t_0) = \int_{t_0}^{+\infty} t \cos t \, dt
\]

neither is convergent nor divergent to \( \infty \). Therefore Eq. (3.13) is not extremal.

### 4. The asymptotic behavior of solutions of systems of two first-order linear quaternionic ordinary differential equations

Let \( a_{ml}(t), \, m, l = 1, 2 \) be quaternionic-valued continuous functions on \( [t_0, +\infty) \). Consider the linear system

\[
(4.1) \quad \begin{cases}
\phi' = a_{11}(t)\phi + a_{12}(t)\psi, \\
\psi' = a_{21}(t)\phi + a_{22}(t)\psi, \quad t \geq t_0
\end{cases}
\]

and the quaternionic Riccati equation

\[
(4.2) \quad q' + qa_{12}(t)q + qa_{11}(t) - a_{22}(t)q - a_{21}(t) = 0, \quad t \geq t_0.
\]
It is not difficult to verify that the solutions $q(t)$ of Eq. (4.2), existing on some interval $[t_1, t_2]$ ($t_0 \leq t_1 < t_2 \leq +\infty$) are connected with solutions $(\phi(t), \psi(t))$ of the system (4.1) by relations

\[(4.3) \quad \phi'(t) = [a_{12}(t)q(t) + a_{11}(t)]\phi(t), \quad \psi(t) = q(t)\phi(t), \quad t \in [t_1, t_2].\]

From here it follows

$$\widehat{\phi}(t') = [a_{12}(t)q(t) + a_{11}(t)]\widehat{\phi}(t), \quad t \in [t_1, t_2).$$

By Liouville’s formula from here we obtain

$$\det \widehat{\phi}(t) = \det \widehat{\phi}(t_1) \exp \left\{ \int_{t_1}^{t} \text{tr} \left[ a_{12}(\tau)q(\tau) + a_{11}(\tau) \right] d\tau \right\}, \quad t \in [t_1, t_2).$$

By virtue of Lemma 2.1 from here it follows

$$|\phi(t)| = |\phi(t_1)| \exp \left\{ \int_{t_1}^{t} \text{Re} \left[ a_{12}(\tau)q(\tau) + a_{11}(\tau) \right] d\tau \right\}, \quad t \in [t_1, t_2).$$

So if $\phi(t_1) \neq 0$, then

$$\phi(t) \neq 0, \quad t \in [t_1, t_2).$$

**Remark 4.1.** It can be shown that if for a solution $(\phi(t), \psi(t))$ of the system (4.1) the function $\phi(t)$ does not vanish on $[t_1, t_2)$ then $q(t) = \psi(t)\phi^{-1}(t)$, $t \in [t_1, t_2)$ is a solution of Eq. (4.2) on $[t_1, t_2)$.

**Definition 4.1.** A solution $(\phi(t), \psi(t))$ of the system (4.1) is called $t_1$-regular ($t_1 \geq t_0$) if $\phi(t) \neq 0$, $t \geq t_1$.

**Definition 4.2.** A $t_1$-regular ($t_1 \geq t_0$) solution $(\phi(t), \psi(t))$ of the system (4.1) is called principal (non principal) if $q(t) \equiv \psi(t)\phi^{-1}(t)$, $t \geq t_1$ is a $t_1$-extremal ($t_1$-normal) solution of Eq. (4.2).

**Definition 4.3.** The system (4.1) is called regular if it has at least one $t_1$-regular solution for some $t_1 \geq t_0$.

**Remark 4.2.** It follows from (4.5) and Remark 4.5 that the system (4.1) has a $t_1$-regular solution for some $t_1 \geq t_0$ if and only if Eq. (4.2) has a $t_1$-regular solution.

**Remark 4.3.** If $(\phi(t), \psi(t))$ is a solution of the system (4.1) then for every $\lambda \in \mathbb{H}(\phi(t)\lambda, \psi(t)\lambda)$ is also a solution of the system (4.1), but $(\lambda\phi(t), \lambda\psi(t))$ may not be a solution of the system (4.1). For example $(e^{it}, e^{kt})$, $t \geq t_0$ is a solution of the system

\[
\begin{cases}
\phi' = i\phi, \\
\psi' = k\psi, \quad t \geq t_0
\end{cases}
\]

but $(je^{it}, je^{kt})$, $t \geq t_0$ is not a solution of this system.

**Definition 4.4.** The solutions $(\phi_m(t), \psi_m(t))$, $m = 1, 2$ are called linearly dependent if there exists $\lambda \in \mathbb{H}\setminus\{0\}$ such that $\phi_2(t) = \phi_1(t)\lambda$, $\psi_2(t) = \psi_1(t)\lambda$, otherwise they are called linearly independent.
Remark 4.4. It follows from Theorem 3.1 and Remark 4.5 that if the system (4.1) has a \( t_1 \)-regular solution \((\phi(t), \psi(t))\), then it has also another \( t_1 \)-regular solution, linearly independent of \((\phi(t), \psi(t))\).

Definition 4.5. The regular system (4.1) is called normal (irreconcilable, sub extremal, super extremal, extremal) if Eq. (4.2) is normal (irreconcilable, sub extremal, super extremal, extremal).

Hereafter every \( t_1 \)-regular solution of the system (4.1) we will just call a regular solution of the system (4.1). On the basis of (4.4) from Corollary 3.1 we immediately get.

Theorem 4.1. The following statements are valid:

I) if the system (4.1) is normal then for its two regular solutions \((\phi_m(t), \psi_m(t))\), \(m = 1, 2\) the inequalities

\[
\limsup_{t \to +\infty} \frac{|\phi_1(t)|}{|\phi_2(t)|} < +\infty, \quad \limsup_{t \to +\infty} \frac{|\phi_2(t)|}{|\phi_1(t)|} < +\infty
\]

are valid;

II) if the system (4.1) is irreconcilable then for its two arbitrary linearly independent regular solutions \((\phi_m(t), \psi_m(t))\), \(m = 1, 2\) the equalities

\[
\limsup_{t \to +\infty} \frac{|\phi_1(t)|}{|\phi_2(t)|} = \limsup_{t \to +\infty} \frac{|\phi_2(t)|}{|\phi_1(t)|} = +\infty
\]

are valid;

III) if the system (4.1) is sub extremal then there exists a regular solution \((\phi_*(t), \psi_*(t))\) of (4.1) such that for every regular solutions \((\phi_m(t), \psi_m(t))\), \(m = 1, 2\) of (4.1) linearly independent of \((\phi_*(t), \psi_*(t))\) the relations

\[
\limsup_{t \to +\infty} \frac{|\phi_*(t)|}{|\phi_1(t)|} < +\infty, \quad \liminf_{t \to +\infty} \frac{|\phi_*(t)|}{|\phi_1(t)|} = 0 ,
\]
\[
\limsup_{t \to +\infty} \frac{|\phi_1(t)|}{|\phi_2(t)|} < +\infty, \quad \limsup_{t \to +\infty} \frac{|\phi_2(t)|}{|\phi_1(t)|} < +\infty
\]

are valid;

IV) if the system (4.1) is super extremal then there exist two regular solutions \((\phi_*(t), \psi_*(t))\) and \((\phi^*(t), \psi^*(t))\) of (4.1) such that

\[
\limsup_{t \to +\infty} \frac{|\phi_*(t)|}{|\phi^*(t)|} = \limsup_{t \to +\infty} \frac{|\phi^*(t)|}{|\phi_*(t)|} = +\infty
\]

and for all two arbitrary solutions \((\phi_m(t), \psi_m(t))\), \(m = 1, 2\) of (4.1) linearly independent of each \((\phi_*(t), \psi_*(t))\) and \((\phi^*(t), \psi^*(t))\) the following relations are
valid
\[
\limsup_{t \to +\infty} \left| \phi_1(t) \right| < +\infty, \quad \limsup_{t \to +\infty} \left| \phi_2(t) \right| < +\infty,
\]
\[
\limsup_{t \to +\infty} \left| \phi_\ast(t) \right| < +\infty, \quad \limsup_{t \to +\infty} \left| \phi_\ast(t) \right| < +\infty,
\]
\[
\liminf_{t \to +\infty} \left| \phi_\ast(t) \right| = \liminf_{t \to +\infty} \left| \phi_\ast(t) \right| = 0, \quad m = 1, 2.
\]

Theorem 4.1 shows that in the normal case of the system (4.1) all regular solutions of (4.1) are asymptotically equivalent. This case differs from the other cases by the scarcity of asymptotic behavior patterns at $+\infty$ of the solutions of the system (4.1). In the supercritical case of (4.1) we have “the richest” (among the other cases) variety of asymptotic behavior pattern at $+\infty$ of regular solutions of the system (4.1).

Let
\[
a_{12}(t) = a_0(t) + ia_1(t) + ja_2(t) + ka_3(t), \quad -a_{22}(t) = b_0(t) + ib_1(t) + jb_2(t) + kb_3(t),
\]
\[
a_{11}(t) = c_0(t) + ic_1(t) + jc_2(t) + kc_3(t), \quad -a_{21}(t) = d_0(t) + id_1(t) + jd_2(t) + kd_3(t).
\]
where $a_m(t), b_m(t), c_m(t)$ and $d_m(t), m = 0, 3$ are real-valued continuous functions on $[t_0, +\infty)$. Set:
\[
p_{0,m}(t) \equiv b_m(t) + c_m(t), \quad m = 1, 3
\]
\[
p_{11}(t) \equiv b_1(t) + c_1(t), \quad p_{12}(t) \equiv b_2(t) - c_2(t),
\]
\[
p_{13}(t) \equiv b_3(t) - c_3(t), \quad p_{21}(t) \equiv b_1(t) - c_1(t),
\]
\[
p_{22}(t) \equiv b_2(t) + c_2(t), \quad p_{23}(t) \equiv b_3(t) - c_3(t),
\]
\[
p_{3m}(t) \equiv b_m(t) - c_m(t), \quad m = 1, 3, \quad t \geq t_0.
\]
\[
D_0(t) \equiv \begin{cases} 
\sum_{m=1}^{3} p_{0m}^2(t) + 4a_0(t)d_0(t), & \text{if } a_0(t) \neq 0, \\
4d_0(t) & \text{if } a_0(t) = 0,
\end{cases}
\]
\[
D_n(t) \equiv \begin{cases} 
\sum_{m=1}^{3} p_{nm}^2(t) - 4a_n(t)d_n(t), & \text{if } a_n(t) \neq 0, \\
-4d_n(t) & \text{if } a_n(t) = 0, \quad n = 1, 3, \quad t \geq t_0.
\end{cases}
\]

Let $\mathcal{S}$ be a non empty subset of the set $\{0, 1, 2, 3\}$ and let $\bar{\mathcal{S}}$ be its complement i. e. $\mathcal{D} = \{0, 1, 2, 3\} \backslash \mathcal{S}$.

**Theorem 4.2.** Let the conditions
\(\alpha)\quad a_n(t) \geq 0, \quad t \geq t_0, \quad n \in \mathcal{S} \quad \text{and if } a_n(t) = 0 \text{ then } p_{nm}(t) = 0, \quad m \in \mathcal{S}, \quad a_n(t) \equiv 0, \quad n \in \bar{\mathcal{S}}, \quad D_n(t) \leq 0, \quad t \geq t_0, \quad n = 0, 3;
\)
\(\beta)\quad \int_{t_0}^{+\infty} |a_{12}(\tau)| \exp \left\{ \int_{t_0}^{t} \left[ \Re a_{22}(s) - \Re a_{11}(s) \right] ds \right\} d\tau < +\infty.
\)
be satisfied. Then the following statements are valid:
1) the system (4.1) is or else normal or else extremal:
2) for all $T$-regular ($T \geq t_0$) non principal solutions $(\phi(t), \psi(t))$ of the system (4.1) the integral
\[ \int_{T}^{+\infty} \frac{|a_{12}(\tau)|}{|\phi(\tau)|^2} \exp \left\{ \int_{T}^{\tau} \left[ \text{Re} \ a_{11}(s) + \text{Re} \ a_{22}(s) \right] ds \right\} d\tau \]
converges;

3) if the system (4.1) is extremal, then:

31) for its unique (up to arbitrary right multiplier) principal solution $(\phi_*(t), \psi_*(t))$ the equality
\[ \lim_{t \to +\infty} \frac{|\phi_*(t)|}{|\phi(t)|} = 0 \]
is valid, where $T_* \geq t_0$ such that $\phi_*(t) \neq 0$, $t \geq T_*$;

32) for all non principal solutions $(\phi(t), \psi(t))$ of the system (4.1) the equality
\[ \lim_{t \to +\infty} \frac{|\phi_1(t)|}{|\phi_2(t)|} = c \neq 0 \]
is valid;

33) for two arbitrary non principal solutions $(\phi_m(t), \psi_m(t))$, $m = 1, 2$ of the system (4.1) the relation
\[ \lim_{t \to +\infty} \frac{|\phi_1(t)|}{|\phi_2(t)|} = c \neq 0 \]
is valid.

To prove this theorem we need in the following result from [11] (see [11, Theorem 3.1])

**Theorem 4.3.** Let the conditions $\alpha$) of Theorem 4.2 be satisfied. Then for all $\gamma_n \geq 0$, $n \in \mathcal{S}$, $\gamma_n \in (-\infty, +\infty)$, $n \in \mathcal{D}$ Eq. (4.2) has a solution $q_0(t) = q_{0,0}(t) - i q_{0,1}(t) - j q_{0,2}(t) - k q_{0,3}(t)$ on $[t_0, +\infty)$ with $q_{0,n}(t_0) = \gamma_n$, $n = 0, 3$ and $q_{0,n}(t) \geq 0$, $n \in \mathcal{S}$, $t \geq t_0$.

**Proof of Theorem 4.2.** Let $q_0(t)$ be the solution of Eq. (4.2) with $q_0(t_0) = 0$. In virtue of Theorem 4.3 it follows from the conditions $\alpha$) of the theorem that $q_0(t)$ is $t_0$-regular and
\[ \text{Re} \ a_{12}(t) q_0(t) \geq 0, \quad t \geq t_0. \]

Consider the integral
\[ \tilde{\nu}_{q_0}(t) \equiv \int_{t}^{+\infty} \phi_{q_0}^{-1}(\tau) a_{12}(\tau) \psi_{q_0}^{-1}(\tau) d\tau, \quad t \geq t_0, \]
where $\phi_{q_0}(t)$ and $\psi_{q_0}(t)$ are the solutions of the linear equations
\begin{align}
\phi' &= [a_{12}(t)q_0(t) + a_{11}(t)]\phi, \quad t \geq t_0, \\
\psi' &= \psi[q_0(t)a_{12}(t) - a_{22}(t)], \quad t \geq t_0
\end{align}
(4.10)
respectively with $\phi_{q_0}(t_0) = \psi_{q_0}(t_0) = 1$. By (2.7) and (2.8) we have respectively
\begin{align}
|\phi_{q_0}(t)| &= \exp\left\{ \int_{t_0}^{t} \text{Re} \left[ a_{12}(\tau)q_0(\tau) + a_{11}(\tau) \right] \right\}, \\
(4.11)
|\psi_{q_0}(t)| &= \exp\left\{ \int_{t_0}^{t} \text{Re} \left[ a_{12}(\tau)q_0(\tau) - a_{22}(\tau) \right] \right\}, \quad t \geq t_0.
\end{align}
Hence,
\begin{align}
(4.12) \quad |\tilde{\nu}_{q_0}(t)| &\leq \int_{t}^{+\infty} \frac{|a_{12}(\tau)|}{|\phi_{q_0}(\tau)||\psi_{q_0}(\tau)|} d\tau \\
&= \int_{t}^{+\infty} |a_{12}(\tau)| \exp \left\{ -\int_{t_0}^{\tau} \left[ 2 \text{Re} a_{12}(s)q_0(s) + \text{Re} a_{11}(s) - \text{Re} a_{22}(s) \right] ds \right\} d\tau, \quad t \geq t_0.
\end{align}
This together with (4.9) and $\beta$ implies that
\begin{align}
(4.13) \quad |\tilde{\nu}_{q_0}(t)| &\leq \int_{t}^{+\infty} |a_{12}(\tau)| \exp \left\{ \int_{t_0}^{\tau} \left[ \text{Re} a_{11}(s) + \text{Re} a_{22}(s) \right] ds \right\} d\tau < +\infty, \quad t \geq t_0.
\end{align}
It follows from here that the integrals $\tilde{\nu}_{q_0}(t), t \geq t_0$ converge. Two cases are possible:

a) $\tilde{\nu}_{q_0}(t)$ has arbitrary large zeroes;
b) $\tilde{\nu}_{q_0}(t) \neq 0$, $t \geq T_0$ for some $T_0 \geq t_0$.

Then by Theorem 3.3 the system (4.1) is or else normal (in the case a)) or else extremal (in the case b)). The statement 1) of the theorem is proved. Let $(\phi_0(t), \psi_0(t))$ be the solution of the system (4.1) with $\phi_0(t_0) = 1$, $\psi_0(t_0) = 0$. Then by (4.3) $\phi_0(t)$ is a solution of Eq. (4.10). So $\phi_0(t)$ coincides with $\phi_{q_0}(t)$. Therefore from $\beta$, (4.9) and (4.11) it follows
\begin{align}
(4.14) \quad \int_{t}^{+\infty} \frac{|a_{12}(\tau)|}{|\phi_{q_0}(\tau)|^2} \exp \left\{ \int_{t_0}^{\tau} \left[ \text{Re} a_{11}(s) + \text{Re} a_{22}(s) \right] ds \right\} d\tau \\
&\leq \int_{t}^{+\infty} |a_{12}(\tau)| \exp \left\{ \int_{t_0}^{\tau} \left[ \text{Re} a_{22}(s) - \text{Re} a_{11}(s) \right] ds \right\} d\tau < +\infty, \quad t \geq t_0.
\end{align}
Let $(\phi(t), \psi(t))$ be a $T$-regular ($T \geq t_0$) non principal solution of the system (4.1). Then $q(t) \equiv \psi(t)\phi^{-1}(t), t \geq T$ is a $T$-normal solution of Eq. (4.2). It follows from
that \( \mu_{q_0}(T; t) \) is bounded on \([T, +\infty)\). Hence, according to the statement 1) of Corollary 3.1 we have

\[
\sup_{t \geq T} \left| \int_{T}^{t} \Re \left[ a_{12}(\tau)(q_0(\tau) - q(\tau)) \right] d\tau \right| < +\infty.
\]

This together with (4.10) implies

\[
\int_{T}^{\infty} \frac{|a_{12}(\tau)|}{|\phi(\tau)|^2} \exp \left\{ \int_{T}^{\tau} \Re a_{11}(s) + \Re a_{22}(s) ds \right\} d\tau
\]

\[
= \int_{T}^{\infty} \frac{|a_{12}(\tau)|}{|\phi_0(\tau)|^2} \exp \left\{ \int_{T}^{\tau} \Re a_{11}(s) + \Re a_{22}(s) ds \right\} d\tau
\]

\[
\times \exp \left\{ 2 \int_{T}^{\tau} \Re \left[ a_{12}(s)(q_0(s) - q(s)) \right] ds \right\} d\tau
\]

\[
\leq M \int_{T}^{\infty} \frac{|a_{12}(\tau)|}{|\phi_0(\tau)|^2} \exp \left\{ \int_{t_0}^{\tau} \Re a_{11}(s) + \Re a_{22}(s) ds \right\} d\tau < +\infty,
\]

where

\[
M \equiv \exp \left\{ - \int_{t_0}^{T} \Re a_{11}(s) + \Re a_{22}(s) ds \right\}
\]

\[
\times \exp \left\{ 2 \sup_{t \geq T} \left| \int_{t_0}^{\tau} \Re \left[ a_{12}(s)(q(s) - q(s)) \right] ds \right| \right\} < +\infty.
\]

The statement 2) of the theorem is proved. Assume the system (4.1) is extremal. Then Eq. (4.2) has the unique extremal solution \( q_*(t) \). Let \( q_*(t) \) be \( T_* \)-regular for some \( T_* \geq t_0 \) and let \( (\phi_*(t), \psi_*(t)) \) be the solution of the system (4.1) with \( \phi_*(T_*) = 1, \ \psi_*(T_*) = q_*(T_*) \). Then by (4.3) \( (\phi_*(t), \psi_*(t)) \) is the unique (up to arbitrary right multiplier) principal solution of the system (4.1) and \( \phi_*(t) \) is a solution of the linear equation

(4.15)

\[
\phi' = \left[ a_{12}(t)q_*(t) + a_{11}(t) \right] \phi, \quad t \geq T_*.
\]

Consider the integral

\[
\tilde{\nu}_{q_*}(T_*) \equiv \int_{T_*}^{\infty} \phi_{q_*}^{-1}(\tau)a_{12}(\tau)\psi_{q_*}^{-1}(\tau)d\tau,
\]

where \( \phi_{q_*}(t) \) and \( \psi_{q_*}(t) \) are the solutions of Eq. (4.15) and the equation

\[
\psi' = \psi[q_*(t)a_{12}(t) - a_{22}(t)], \quad t \geq T_*,
\]
respectively with $\phi_*(T_*) = \psi_*(T_*) = 1$. Since $q_*(t)$ is extremal in virtue of Theorem 3.3 we have

\begin{equation}
\tilde{\nu}_*(T_*) = \infty.
\end{equation}

By (2.7) and (2.8) we have respectively

$$
|\phi_*(t)| = \exp\left\{ \int_{T_*}^t \text{Re} \left[ a_{12}(\tau)q_*(\tau) + a_{11}(\tau) \right] d\tau \right\}, \quad t \geq T_*,
$$

$$
|\psi_*(t)| = \exp\left\{ \int_{T_*}^t \text{Re} \left[ a_{12}(\tau)q_*(\tau) - a_{22}(\tau) \right] d\tau \right\}, \quad t \geq T_*.
$$

Therefore

\begin{equation}
|\psi_*(t)| = |\phi_*(t)| \exp \left\{ - \int_{T_*}^t \text{Re} \left[ a_{11}(\tau) + a_{22}(\tau) \right] d\tau \right\}, \quad t \geq T_*.
\end{equation}

Obviously $\phi_*(t) = \phi_*(t), \quad t \geq T_*$. This together with (4.17) implies

$$
|\tilde{\nu}_*(T_*)| \leq \int_{T_*}^{+\infty} \frac{|a_{12}(\tau)|}{|\phi_*(\tau)|^2} \exp \left\{ \int_{T_*}^\tau \text{Re} \left[ a_{11}(s) + a_{22}(s) \right] ds \right\} d\tau.
$$

From here and from (4.16) it follows (4.6). Let $(\phi(t), \psi(t))$ be a non principal solution of the system (4.1). Without loss of generality we may take that $(\phi(t), \psi(t))$ is $T_*$-regular. Then $q(t) \equiv \psi(t)\phi^{-1}(t), \quad t \geq T_*$ is a $T_*$-normal solution of Eq. (4.2). By (3.7) from here it follows

$$
\int_{T_*}^{+\infty} \text{Re} \left[ a_{12}(\tau)(q_*(\tau) - q(\tau)) \right] d\tau = -\infty.
$$

By (2.7) from here we obtain (4.7):

$$
\lim_{t \to +\infty} \frac{|\phi_*(t)|}{|\phi(t)|} = \lim_{t \to +\infty} \exp \left\{ \int_{T_*}^t \text{Re} \left[ a_{12}(\tau)(q_*(\tau) - q(\tau)) \right] d\tau \right\} = 0.
$$

Let $(\phi_m(t), \psi_m(t)), \quad m = 1, 2$ be non principal $T$-regular ($T \geq t_0$) solutions of the system (4.1). By (4.3) $q_m(t) = \psi_m(t)\phi_m^{-1}(t), \quad t \geq T, \quad m = 1, 2$ are $T$-normal solutions of Eq. (4.2). Then according to the statement 4) of Theorem 3.3 the integral

$$
\int_{T_*}^{+\infty} \text{Re} \left[ a_{12}(\tau)(q_1(\tau) - q_2(\tau)) \right] d\tau
$$

converges. By (2.7) from here it follows (4.8). The theorem is proved. \qed
Remark 4.5. From the estimate (4.13) is seen that if $\text{supp} a_{12}(t)$ is bounded, then $\tilde{\nu}_{q_0}(t)$ has arbitrary large zeroes. Hence in this case under the conditions of Theorem 4.2 the system is normal. If $\text{supp} a_{12}(t)$ is unbounded and the coefficients of the system (4.1) are real-valued, then it is not difficult to verify that under the conditions of Theorem 4.1 $\tilde{\nu}_{q_0}(t) \neq 0, t \geq t_0$. So in this case (4.1) is extremal.
