A NOTE ON SPECIAL SMARANDACHE CURVES IN THE NULL CONE $Q^3$

F. Almaz, M.A. Külahci

Abstract. As it is well-known, the geometry of curve in three-dimensions is actually characterized by Frenet vectors. In this paper, we obtain Smarandache curves by using cone frame formulas in null cone $Q^3$. Also, we give an example related to these curves.

2010 Mathematics Subject Classification: 53A40, 53A35.

Keywords: smarandache curve, asymptotic orthonormal frame, null cone.

1. Introduction

Human being were bewitched by curves and curved shapes long before they took into account them as mathematical objects. But the greatest effect in the research of curves was, of course, the discovery of the calculus. Geometry before calculus includes only the simplest curves.

Smarandache geometry is a geometry which has at least one Smarandachely denied axiom [4]. An axiom is said to be Smarandachely denied, if it behaves in at least two different ways within the same space. Smarandache curve is defined as a regular curve whose position vector is composed by Frenet frame vectors of another regular curve.

The popularity of Smarandache curves in various ambient spaces have been classified in [1]-[7], [13]-[16]. In this study, we define special Smarandache curves such as $x\alpha\beta, x\beta y, x\alpha y, \alpha\beta y$-Smarandache curves according to asymptotic orthonormal frame in the null cone $Q^3$ and we examine the curvatures and the asymptotic orthonormal frame’s vectors of Smarandache curves. We also give an example related to these curves.
2. Preliminaries

Some basics of the curves in the null cone are provided from, [8]-[9].

Let $E_4^1$ be the 4-dimensional pseudo-Euclidean space with the
\[ \tilde{g}(X,Y) = \langle X,Y \rangle = x_1y_1 + x_2y_2 + x_3y_3 - x_4y_4 \]
for all $X = (x_1,x_2,x_3,x_4)$, $Y = (y_1,y_2,y_3,y_4) \in E_4^1$. $E_4^1$ is a flat pseudo-Riemannian manifold of signature $(3,1)$.

Let $M$ be a submanifold of $E_4^1$. If the pseudo-Riemannian metric $\tilde{g}$ of $E_4^1$ induces a pseudo-Riemannian metric $g$ (respectively, a Riemannian metric, a degenerate quadratic form) on $M$, then $M$ is called a timelike (respectively, spacelike, degenerate) submanifold of $E_3^1$. Let $c$ be a fixed point in $E_4^1$. The pseudo-Riemannian lightlike cone (quadric cone) is defined by
\[ Q_{3}^1(c) = \{ x \in E_4^1 : g(x - c, x - c) = 0 \}, \]
where the point $c$ is called the center of $Q_{3}^1(c)$. When $c = 0$, we simply denote $Q_{3}^1(0)$ by $Q^3$ be and call it the null cone.

Let $E_4^1$ be 4-dimensional Minkowski space and $Q^3$ the lightlike cone in $E_4^1$. A vector $V \neq 0$ in $E_4^1$ is called spacelike, timelike or lightlike, if $\langle V,V \rangle > 0$, $\langle V,V \rangle < 0$ or $\langle V,V \rangle = 0$, respectively. The norm of a vector $x \in E_4^1$ is given by $\| x \| = \sqrt{\langle x,x \rangle}$, [12].

We assume that curve $x : I \to Q^3 \subset E_4^1$ is a regular curve in $Q^3$ for $t \in I$. In the following, we always assume that the curve is regular.

A frame field $\{ x, \alpha, \beta, y \}$ on $E_4^1$ is called an asymptotic orthonormal frame field, if
\[ \langle x,x \rangle = \langle y,y \rangle = \langle x,\alpha \rangle = \langle y,\alpha \rangle = \langle \beta,\alpha \rangle = \langle y,\beta \rangle = \langle x,\beta \rangle = 0, \]
\[ \langle x,y \rangle = \langle \alpha,\alpha \rangle = \langle \beta,\beta \rangle = 1. \]

Using $x'(s) = \alpha(s)$ we know that $\{ x(s), \alpha(s), \beta(s), y(s) \}$ from an asymptotic orthonormal frame along the curve $x(s)$ and the cone frenet formulas of $x(s)$ are given by
\[ x'(s) = \alpha(s) \]
\[ \alpha'(s) = \kappa(s)x(s) - y(s) \]
\[ \beta'(s) = \tau(s)x(s) \]
\[ y'(s) = -\kappa(s)\alpha(s) - \tau(s)\beta(s) \]
\[ (2.1) \]
where the functions $\kappa(s)$ and $\tau(s)$ are called cone curvature functions of the curve $x(s)$, [10].
Let \( x : I \rightarrow Q^3 \subset E^4_1 \) be a spacelike curve in \( Q^3 \) with an arc length parameter \( s \). Then \( x = x(s) = (x_1, x_2, x_3, x_4) \) can be written as
\[
x(s) = \frac{1}{2\sqrt{f^2(s) + g^2(s)}} (2f, 2g, 1 - f^2 - g^2, 1 + f^2 + g^2)
\] (2.2)
for some non constant function \( f(s) \) and \( g(s) \), [11].

3. Smarandache Curves in The Null Cone \( Q^3 \)

In this section, we define binary Smarandache curves according to the asymptotic orthonormal frame in \( Q^3 \). Also, we obtain the asymptotic orthonormal frame and cone curvature functions of the Smarandache partners lying on \( Q^3 \) using cone frenet formulas.

Smarandache curve \( \gamma = \gamma(s^*(s)) \) of the curve \( x \) is a regular unit speed curve lying fully on \( Q^3 \). Let \( \{x, \alpha, \beta, y\} \) and \( \{\gamma, \alpha_\gamma, \beta_\gamma, y_\gamma\} \) be the moving asymptotic orthonormal frames of \( x \) and \( \gamma \), respectively.

**Definition 1.** Let \( x \) be unit speed spacelike curve lying on \( Q^3 \) with the moving asymptotic orthonormal frame \( \{x, \alpha, \beta, y\} \). Then, \( x\alpha\beta-Smarandache curve of \( x \) is defined by
\[
\gamma_{x\alpha\beta}(s^*) = \frac{1}{\sqrt{b^2 + c^2}} (ax(s) + b\alpha(s) + c\beta(s)),
\] (3.1)
where \( a, b, c \in \mathbb{R}_0^+ \).

**Theorem 1.** Let \( x \) be unit speed spacelike curve in \( Q^3 \) with the moving asymptotic orthonormal frame \( \{x, \alpha, \beta, y\} \) and cone curvatures \( \kappa(s), \tau(s) \) and let \( \gamma_{x\alpha\beta} \) be \( x\alpha\beta-Smarandache curve with asymptotic orthonormal frame \( \{\gamma_{x\alpha\beta}, \alpha_{x\alpha\beta}, \beta_{x\alpha\beta}, y_{x\alpha\beta}\} \). Then the following relations hold:

i) The asymptotic orthonormal frame \( \{\gamma_{x\alpha\beta}, \alpha_{x\alpha\beta}, \beta_{x\alpha\beta}, y_{x\alpha\beta}\} \) of the \( x\alpha\beta-Smarandache curve \( \gamma_{x\alpha\beta} \) is given as
\[
\begin{bmatrix}
\gamma_{x\alpha\beta} \\
\alpha_{x\alpha\beta} \\
\beta_{x\alpha\beta} \\
y_{x\alpha\beta}
\end{bmatrix} = 
\begin{bmatrix}
a \\
\frac{b}{\sqrt{b^2 + c^2}} \\
\frac{a}{\sqrt{b^2 + c^2}} \\
0 \\
-\frac{b}{\sqrt{b^2 + c^2}}
\end{bmatrix} 
\begin{bmatrix}
x \\
\alpha \\
\beta \\
y
\end{bmatrix},
\] (3.2)
where
\[ \Psi = \sqrt{a^2 - 2b(b\kappa + c\tau)}, w = \frac{\Psi}{\sqrt{b^2 + c^2}} \] (3.3)
\[ A_1 = \frac{b\kappa + c\tau}{\Psi}, A_2 = \frac{a}{\Psi}, A_3 = \frac{1}{w}; \] (3.4)

and
\[ B_1 = \frac{\sqrt{b^2 + c^2}}{\Psi^3} (\Psi'(b\kappa + c\tau) + \Psi(b\kappa' + c\tau') + a\Psi\kappa), \] (3.5)
\[ B_2 = \frac{\sqrt{b^2 + c^2}}{\Psi^3} (\Psi(b\kappa + c\tau) - a - \Psi\kappa\sqrt{b^2 + c^2}), \]
\[ B_3 = -\tau(b^2 + c^2), B_4 = \frac{\sqrt{b^2 + c^2}}{\Psi^2} (-a\Psi + \sqrt{b^2 + c^2}); \]
\[ \Upsilon_1 = -B_1 - \frac{aD}{2\sqrt{b^2 + c^2}}, \Upsilon_2 = -B_2 - \frac{bD}{2\sqrt{b^2 + c^2}}, \Upsilon_3 = -B_3 - \frac{cD}{2\sqrt{b^2 + c^2}}, \]
\[ \Upsilon_4 = -B_4 \]

and
\[ D = 2\frac{(A_1' + \kappa A_2)(-A_2 + A_3')}{w^2} + \frac{1}{w^2}(A_1 + A_2' - \kappa A_3)^2 + (\tau A_4)^2 \]
or
\[ D = \frac{(b^2 + c^2)}{\Psi^6} (-2(\Psi'(b\kappa + c\tau) + \Psi(b\kappa' + c\tau') + a\Psi\kappa)(a\Psi + \sqrt{b^2 + c^2}) \]
\[ + (\Psi(b\kappa + c\tau) - a - \Psi\kappa\sqrt{b^2 + c^2})^2 + \frac{\tau^2(b^2 + c^2)}{\Psi^2} \]

ii) The cone curvatures \( \kappa_{\gamma_{x0\beta}}(s^*) \) and \( \tau_{\gamma_{x0\beta}}(s^*) \) of the curve \( \gamma_{x0\beta} \) is given by

\[ \kappa_{\gamma_{x0\beta}}(s^*) = -\frac{D}{2} \]
\[ \tau_{\gamma_{x0\beta}}(s^*) = \sqrt{2(\Upsilon_1 - \kappa')\Upsilon_4 + (\Upsilon_2 - \kappa)^2 + \Upsilon_3^2 - \kappa^2_{\gamma_{x0\beta}}}, \] (3.6)

where
\[ s^* = \frac{1}{\sqrt{b^2 + c^2}} \int \sqrt{a^2 - 2b(b\kappa + c\tau)} ds. \]
Proof. i) We assume that the curve $x$ is a unit speed spacelike curve with the asymptotic orthonormal frame $\{x, \alpha, \beta, y\}$ and cone curvatures $\kappa, \tau$. Differentiating the equation (3.1) with respect to $s$ and considering (2.1), we have

$$\gamma'_{x\alpha\beta}(s^*) = \left(\frac{a}{\Psi}\right)\alpha(s) + \left(\frac{b\kappa + c\tau}{\Psi}\right)x(s) + \left(\frac{1}{w}\right)y(s),$$

(3.7)

where

$$w = \frac{ds^*}{ds} = \frac{1}{\sqrt{b^2 + c^2}}\sqrt{a^2 - 2b(b\kappa + c\tau)},$$

(3.8)

$$\Psi = \sqrt{a^2 - 2b(b\kappa + c\tau)}.$$  

(3.9)

It can be easily seen that the tangent vector $\gamma'_{x\alpha\beta}(s^*) = \alpha_{x\alpha\beta}(s^*)$ is a unit spacelike vector.

Differentiating (3.7), we obtain equation as follows

$$\gamma''_{x\alpha\beta}(s^*) = B_1x(s) + B_2\alpha(s) + B_3\beta(s) + B_4y(s),$$

(3.10)

where $B_1 = \frac{A_1' + \kappa A_2}{w}$, $B_2 = \frac{A_1 + A_2' - \kappa A_3}{w}$, $B_3 = \frac{-\tau A_3}{w}$, $B_4 = \frac{-A_2 + A_3'}{w}$.

$$y_{x\alpha\beta}(s^*) = -\gamma''_{x\alpha\beta} - \frac{1}{2}\left(\gamma''_{x\alpha\beta}, \gamma''_{x\alpha\beta}\right)\gamma_{x\alpha\beta}$$

(3.11)

By the help of previous equation (3.11), we obtain

$$y_{x\alpha\beta}(s^*) = \Upsilon_1x(s) + \Upsilon_2\alpha(s) + \Upsilon_3\beta(s) + \Upsilon_4y(s),$$

(3.12)

where $\Upsilon_1 = -B_1 - \frac{aD}{2\sqrt{b^2 + c^2}}$, $\Upsilon_2 = -B_2 - \frac{bD}{2\sqrt{b^2 + c^2}}$, $\Upsilon_3 = -B_3 - \frac{cD}{2\sqrt{b^2 + c^2}}$, $\Upsilon_4 = -B_4$.

ii) Using equations $\kappa_{x\alpha\beta}(s^*)$ and $\tau_{x\alpha\beta}(s^*)$ of the $\gamma_{x\alpha\beta}(s^*)$ are explicitly obtained by

$$\kappa_{x\alpha\beta}(s^*) = -\frac{1}{2}D$$

$$\tau_{x\alpha\beta}(s^*) = 2(\Upsilon_1 - \kappa')\Upsilon_4 + (\Upsilon_2 - \kappa)^2 + \Upsilon_3^2 - \kappa_{x\alpha\beta}^2.$$  

(3.13)

Thus, the theorem is proved. \[\blacksquare\]
Definition 2. Let $x$ be unit speed spacelike curve lying on $\mathbb{Q}^3$ with the moving asymptotic orthonormal frame $\{x, \alpha, \beta, y\}$. Then, $x\beta y$–Smarandache curve of $x$ is defined by
\[
\gamma_{x\beta y}(s) = \frac{1}{\sqrt{2ac + b^2}} (ax(s) + b\beta(s) + cy(s)),
\]
where $a, b, c \in \mathbb{R}^+_0$.

Theorem 2. Let $x$ be unit speed spacelike curve in $\mathbb{Q}^3$ with the moving asymptotic orthonormal frame $\{x, \alpha, \beta, y\}$ and cone curvatures $\kappa(s)$, $\tau(s)$ and let $\gamma_{x\beta y}$ be $x\beta y$–Smarandache curve with asymptotic orthonormal frame $\{\gamma_{x\beta y}, \alpha_{x\beta y}, \beta_{x\beta y}, y_{x\beta y}\}$. Then the following relations hold:

i) The asymptotic orthonormal frame $\{\gamma_{x\beta y}, \alpha_{x\beta y}, \beta_{x\beta y}, y_{x\beta y}\}$ of the $x\beta y$–Smarandache curve $\gamma_{x\beta y}$ is given as
\[
\begin{pmatrix}
\gamma_{x\beta y} \\
\alpha_{x\beta y} \\
\beta_{x\beta y} \\
y_{x\beta y}
\end{pmatrix} =
\begin{pmatrix}
\frac{a}{\sqrt{2ac + b^2}} & 0 & \frac{b}{\sqrt{2ac + b^2}} & \frac{c}{\sqrt{2ac + b^2}} \\
\frac{b\tau}{\eta} & \frac{a - c\kappa}{\eta} & \frac{c\tau}{\eta} & 0 \\
B_1^* & B_2^* & B_3^* & B_4^*
\end{pmatrix}
\begin{pmatrix}
x \\
\alpha \\
\beta \\
y
\end{pmatrix},
\]
where
\[
\eta = \sqrt{a^2 - 2ac + c^2(\kappa^2 + \tau^2)}, \omega = \frac{\eta}{\sqrt{2ac + b^2}} = \frac{ds^*}{ds};
\]
\[
A_1 = \frac{b\tau}{\eta}, A_2 = \frac{a - c\kappa}{\eta}, A_3 = \frac{-c\tau}{\eta};
\]
\[
B_1^* = \frac{A_1' + \kappa A_2 + \tau A_3}{w}, B_2^* = \frac{A_1 + A_2'}{w}, B_3^* = \frac{A_3'}{w}, B_4^* = -\frac{A_2}{w}
\]
and
\[
\omega_1 = -B_1^* - \frac{aT}{2\sqrt{2ac + b^2}}, \omega_2 = -B_2^*, \omega_3 = -B_3^* - \frac{bT}{2\sqrt{2ac + b^2}},
\]
\[
\omega_4 = -B_4^* - \frac{cT}{2\sqrt{2ac + b^2}},
\]
\[
T = \frac{1}{\omega^2} (-2A_2(A_1' + \kappa A_2 + \tau A_3) + (A_1 + A_2')^2 + A_4'^2).
\]
or
\[
T = \frac{2ac + b^2}{\eta} \left( \frac{2(\kappa - a)(b(\tau' - \tau) + \eta (\kappa a - c(\kappa^2 + \tau^2)))}{\eta^2} + \frac{1}{\eta^2} \left((\eta (b\tau - c\kappa) + \eta' (a - c\kappa))^2 + \frac{c^2(\tau' - \tau')^2}{\eta^2}\right) \right).
\]
ii) The cone curvature \( \kappa_{x\beta y} (s^*) \) and \( \tau_{x\beta y} (s^*) \) of the curve \( \gamma_{x\beta y} \) is given by

\[
\kappa_{x\beta y} (s^*) = -\frac{T}{2},
\]

\[
\tau_{x\beta y}^2 (s^*) = 2(\omega_1 - \kappa')\omega_4 + (\omega_2 - \kappa)^2 + \omega_3^2 - \kappa_{x\beta y}^2
\]  
(3.16)

where

\[
s^* = \frac{1}{\sqrt{2ac + b^2}} \int \sqrt{a^2 - 2ac + c^2(\kappa^2 + \tau^2)} \, ds.
\]  
(3.17)

Proof. i) We assume that the curve \( x \) is a unit speed spacelike curve with the asymptotic orthonormal frame \( \{ x, \alpha, \beta, y \} \) and cone curvatures \( \kappa, \tau \). Differentiating the equation (3.14) with respect to \( s \) and considering (2.1), we have

\[
\gamma'_{x\beta y} (s^*) = b\tau \eta_{-} - \alpha (s) + a - c\kappa \eta_{-} - \beta (s)
\]  
(3.18)

or

\[
\gamma'_{x\beta y} (s^*) = A_1 \bar{x} + A_2 \bar{\alpha} + A_3 \bar{\beta}.
\]

By considering (3.17), we get

\[
\gamma'_{x\beta y} (s^*) = \alpha (s) = \alpha_{x\beta y}.
\]  
(3.19)

Here, it can be easily seen that the tangent vector \( \bar{\alpha}_{x\beta y} \) is a unit spacelike vector. Differentiating (3.19) and using (3.17), we obtain

\[
\gamma''_{x\beta y} (s^*) = B_1^* \bar{x} + B_2^* \bar{\alpha} + B_3^* \bar{\beta} - B_4^* \bar{y},
\]  
(3.20)

where \( B_1^* = \frac{A_1' + \kappa A_2 + \tau A_3}{w}, B_2^* = \frac{A_1 + A_2'}{w}, B_3^* = \frac{A_3'}{w}, B_4^* = -\frac{A_4}{w} \).

By the help of equation \( y_{x\beta y} (s^*) = -\gamma''_{x\beta y} - \frac{1}{2} \langle \gamma''_{x\beta y}, \gamma''_{x\beta y} \rangle \gamma_{x\beta y}, \) we write

\[
y_{x\beta y} (s^*) = \omega_1 x(s) + \omega_2 \alpha(s) + \omega_3 \beta(s) + \omega_4 y(s),
\]  
(3.21)

where

\[
\omega_1 = -B_1^* - \frac{aT}{2\sqrt{2ac + b^2}} \omega_2 = -B_2^*,
\]

\[
\omega_3 = -B_3^* - \frac{bT}{2\sqrt{2ac + b^2}} \omega_4 = -B_4^* - \frac{cT}{2\sqrt{2ac + b^2}},
\]

ii)

\[
\kappa_{x\beta y} (s^*) = \frac{1}{2} \langle \gamma''_{x\beta y}, \gamma''_{x\beta y} \rangle,
\]

117
\[ \tau_{x,y}^2 (s^*) = \langle \beta - \kappa_0 - \kappa' x, \beta - \kappa_0 - \kappa' x \rangle - \kappa_{x,y}^2. \] (3.22)

By using (3.22), the curvatures \( \kappa_{x,y} (s^*) \) and \( \tau_{x,y} (s^*) \) of the \( \gamma_{x,y} (s^*) \) are explicitly obtained

\[ \kappa_{x,y} (s^*) = \frac{1}{2} \left\langle \gamma_{x,y}'''(s^*), \gamma_{x,y}'''(s^*) \right\rangle = \frac{-T}{2}, \]
\[ \tau_{x,y}^2 (s^*) = 2(\omega_1 - \kappa')\omega_2 + (\omega_2 - \kappa)^2 + \omega_3 - \kappa_{x,y}^2, \]

where

\[ T = \frac{2ac + b^2}{\eta} \left( \frac{2(\kappa_0 - a)}{\eta} (b(\tau' \eta - \tau' \eta') + \eta (\kappa_0 - c (\kappa' + \tau')) + \frac{1}{\eta} (\eta (b\tau - c\kappa) + \eta' (a - c\kappa))^2 + \frac{c^2 (\tau' \eta' - \tau' \eta)^2}{\eta}) \right). \]

**Definition 3.** Let \( x \) be unit speed spacelike curve lying on \( \mathbb{Q}^3 \) with the moving asymptotic orthonormal frame \( \{ x, \alpha, \beta, y \} \). Then, \( x \alpha y \)-Smarandache curve of \( x \) is defined by

\[ \gamma_{x,y} (s^*) = \frac{1}{\sqrt{2ac + b^2}} (ax(s) + bx(s) + cy(s)), \] (3.23)

where \( a, b, c \in \mathbb{R}_0^+ \).

**Theorem 3.** Let \( x \) be unit speed spacelike curve in \( \mathbb{Q}^3 \) with the moving asymptotic orthonormal frame \( \{ x, \alpha, \beta, y \} \) and cone curvatures \( \kappa, \tau \) and let \( \gamma_{x,y} \) be \( x \alpha y \)-Smarandache curve with asymptotic orthonormal frame \( \{ \gamma_{x,y}, \alpha_{x,y}, \beta_{x,y}, y_{x,y} \} \). Then the following relations hold:

i) The asymptotic orthonormal frame \( \{ \gamma_{x,y}, \alpha_{x,y}, \beta_{x,y}, y_{x,y} \} \) of the \( x \alpha y \)-Smarandache curve \( \gamma_{x,y} \) is given as

\[ \begin{bmatrix} \gamma_{x,y} \\ \alpha_{x,y} \\ \beta_{x,y} \\ y_{x,y} \end{bmatrix} = \begin{bmatrix} a & b & 0 & c \\ \frac{a}{\rho_1} & \frac{b}{\rho_1} & \frac{\rho_2}{\rho_3} & \frac{\rho_4}{\rho_3} \\ -\frac{\rho_3}{\rho_1} & \frac{\rho_3}{\rho_1} - \frac{\rho_4}{\rho_1} & \frac{\rho_3}{\rho_1} & \frac{\rho_3}{\rho_1} - \frac{\rho_4}{\rho_1} - \frac{c}{\rho_1} \\ -\frac{\rho_3}{\rho_1} & \frac{\rho_3}{\rho_1} - \frac{\rho_4}{\rho_1} & -\frac{\rho_3}{\rho_1} & -\frac{\rho_3}{\rho_1} \end{bmatrix} \begin{bmatrix} x \\ \alpha \\ \beta \\ y \end{bmatrix}, \] (3.24)

where

\[ \rho_1 = \frac{b\kappa}{\Omega}, \rho_2 = \frac{a - c\kappa}{\Omega}, \rho_3 = \frac{-c\tau}{\Omega}, \rho_4 = \frac{-b}{\Omega}, \]
\[ \Omega = \sqrt{a^2 - 2(ac + b^2) \kappa + c^2(\kappa^2 + \tau^2)}; M = \frac{\Omega}{\sqrt{2ac + b^2}}, \] (3.25)
\[ L = \frac{1}{M^2} (2(\rho'_1 + \kappa \rho_2 + \rho_3 \tau)(-\rho_2 + \rho'_1) + (\rho'_2 + \rho_1 - \kappa \rho_4)^2 + (\rho'_3 - \tau \rho_4)^2), \]

\[ \phi = \frac{L}{2 \sqrt{2ac + b^2}}. \]

ii) The cone curvatures \( \kappa_{\gamma_{x\alpha y}}(s^*) \) and \( \tau_{\gamma_{x\alpha y}}(s^*) \) of the curve \( \gamma_{x\alpha y} \) is given by

\[ \kappa_{\gamma_{x\alpha y}}(s^*) = -\frac{L}{2}, \quad (3.26) \]

\[ \tau_{\gamma_{x\alpha y}}^2(s^*) = 2(\frac{\rho'_1 + \kappa \rho_2 + \rho_3 \tau}{M} + a\phi + \kappa'^{\prime})(\frac{-\rho_2 + \rho'_4}{M} + c\phi) \]

\[ + \left( \frac{\rho'_2 + \rho_1 - \kappa \rho_4}{M} + b\phi + \kappa \right)^2 + \left( \frac{\rho'_3 + \tau \rho_4}{M} \right)^2 - \frac{L^2}{4}, \quad (3.27) \]

where

\[ s^* = \frac{1}{\sqrt{2ac + b^2}} \int \sqrt{a^2 - 2(ac + b^2)\kappa + c^2(\kappa^2 + \tau^2)} ds. \]

**Proof.**

i) Let the curve \( x \) be a unit speed spacelike curve with the asymptotic orthonormal frame \( \{x, \alpha, \beta, y\} \) and cone curvatures \( \kappa, \tau \). Differentiating the equation (3.23) with respect to \( s \) and considering (2.1), we find

\[ \gamma'_{x\alpha y}(s^*) \frac{ds^*}{ds} = \frac{1}{\sqrt{2ac + b^2}} \left( bk \overrightarrow{x(s)} + (a - c\kappa)\overrightarrow{\alpha(s)} - c\tau \overrightarrow{\beta(s)} - b \overrightarrow{y(s)} \right). \]

This can be written as following

\[ \alpha_{x\alpha y}(s^*) = \frac{bk}{\Omega} \overrightarrow{x(s)} + \frac{a - c\kappa}{\Omega} \overrightarrow{\alpha(s)} - \frac{c\tau}{\Omega} \overrightarrow{\beta(s)} - \frac{b}{\Omega} \overrightarrow{y(s)}, \]

where

\[ \Omega = \sqrt{a^2 - 2(ac + b^2)\kappa + c^2(\kappa^2 + \tau^2)}. \]

Differentiating (3.29) and using (3.30), we get

\[ \gamma''_{x\alpha y} = (\frac{\rho'_1 + \kappa \rho_2 + \rho_3 \tau}{M} x + (\frac{\rho'_2 + \rho_1 - \kappa \rho_4}{M} x \overrightarrow{\alpha(s)} - \frac{\rho'_3 + \tau \rho_4}{M} \overrightarrow{\beta(s)} - \frac{b}{\Omega} \overrightarrow{y(s)}), \]

where \( \rho_1 = \frac{bk}{\Omega}, \rho_2 = \frac{a - c\kappa}{\Omega}, \rho_3 = \frac{-c\tau}{\Omega}, \rho_4 = \frac{-b}{\Omega}. \)

\[ y_{x\alpha y}(s^*) = -\gamma''_{x\alpha y} - \frac{1}{2} \left\langle \gamma''_{x\alpha y}, \gamma''_{x\alpha y} \right\rangle \gamma_{x\alpha y} \text{ and } \left\langle \gamma''_{x\alpha y}, \gamma''_{x\alpha y} \right\rangle = L. \]

119
By the help of equation (3.32), we obtain
\[ y_{x_{\alpha y}}(s^*) = \left(-\frac{\rho_1 + \kappa \rho_2 + \rho_3 \tau}{M} - a\phi\right)x(s) + \left(-\frac{\rho'_2 + \rho_1 - \kappa \rho_4}{M} - b\phi\right)\alpha(s) \]
\[ + \left(-\frac{\rho'_3 + \tau \rho_4}{M}\right)\beta(s) + \left(-\frac{\rho_2 + \rho'_4}{M} - c\phi\right)y(s), \]
(3.33)
where
\[ \phi = \frac{L}{2\sqrt{2ac + b^2}}, L = \frac{1}{M^2}(2(\rho'_1 + \kappa \rho_2 + \rho_3 \tau)(-\rho_2 + \rho'_4) + (\rho'_2 + \rho_1 - \kappa \rho_4)^2 + (\rho'_3 - \tau \rho_4)^2), \]

ii) Using (3.22), we have (3.26) and (3.27).

**Definition 4.** Let \( x \) be unit speed spacelike curve lying on \( Q^3 \) with the moving asymptotic orthonormal frame \( \{x, \alpha, \beta, y\} \). Then, \( \alpha\beta y \)–Smarandache curve of \( x \) is defined by
\[ \gamma_{\alpha\beta y}(s^*) = \frac{1}{\sqrt{a^2 + b^2}}(a\alpha(s) + b\beta(s) + cy(s)), \]
(3.34)
where \( a, b, c \in \mathbb{R}^+ \).

**Theorem 4.** Let \( x \) be unit speed spacelike curve in \( Q^3 \) with the moving asymptotic orthonormal frame \( \{x, \alpha, \beta, y\} \) and cone curvatures \( \kappa, \tau \) and let \( \gamma_{\alpha\beta y} \) be \( \alpha\beta y \)–Smarandache curve with asymptotic orthonormal frame \( \{\gamma_{\alpha\beta y}, \alpha_{\alpha\beta y}, \beta_{\alpha\beta y}, y_{\alpha\beta y}\} \). Then the following relations hold:

i) The asymptotic orthonormal frame \( \{\gamma_{\alpha\beta y}, \alpha_{\alpha\beta y}, \beta_{\alpha\beta y}, y_{\alpha\beta y}\} \) of the \( \alpha\beta y \)–Smarandache curve \( \gamma_{\alpha\beta y} \) is given as
\[ \begin{bmatrix} \gamma_{\alpha\beta y} \\ \alpha_{\alpha\beta y} \\ \beta_{\alpha\beta y} \\ y_{\alpha\beta y} \end{bmatrix} = \begin{bmatrix} 0 & \frac{a}{\sqrt{a^2 + b^2}} & \frac{b}{\sqrt{a^2 + b^2}} & \frac{c}{\sqrt{a^2 + b^2}} \\ A_1 & A_2 & A_3 & A_4 \\ C_1 & C_2 & C_3 & C_4 \\ -C_1 & -C_2 & -C_3 & -C_4 \end{bmatrix} \begin{bmatrix} x \\ \alpha \\ \beta \\ y \end{bmatrix}, \]
(3.35)

where
\[ \xi = \sqrt{c^2 \tau^2 + (c^2 - 2a^2) \kappa^2 - 2ab\tau}; w = \frac{\xi}{\sqrt{a^2 + b^2}} = \frac{ds^*}{ds} \]
\begin{align*}
A_1 &= \frac{a \kappa + b \tau}{\xi}, A_2 = \frac{-c \kappa}{\xi}, A_3 = \frac{-c \tau}{\xi}, A_4 = \frac{-a}{\xi}; \\
C_1 &= \frac{\xi'(a \kappa + b \tau) + \xi(a \kappa' + b \tau') - c(\kappa^2 + \tau^2)}{\xi^3 \sqrt{a^2 + b^2}}, \\
C_2 &= \frac{\xi(2a \kappa + b \tau) - c \kappa \xi'}{\xi^3 \sqrt{a^2 + b^2}}, \\
C_3 &= \frac{\xi c(a \tau - \tau') - c \tau \xi'}{\xi^3 \sqrt{a^2 + b^2}}, \\
C_4 &= \frac{c \kappa \xi + a}{\xi^3 \sqrt{a^2 + b^2}}, \\
M &= \frac{-2a(a \kappa + b \tau) + c(\kappa^2 + \tau^2)}{\xi^2}. 
\end{align*}

(3.36)

ii) The cone curvatures \( \kappa_{\gamma_{\alpha\beta \gamma}}(s^*) \) and \( \tau_{\gamma_{\alpha\beta \gamma}}(s^*) \) of the curve \( \gamma_{\alpha\beta \gamma} \) is given by

\begin{align*}
\kappa_{\gamma_{\alpha\beta \gamma}}(s^*) &= \frac{2a(a \kappa + b \tau) - c(\kappa^2 + \tau^2)}{2\xi^2}, \\
\tau_{\gamma_{\alpha\beta \gamma}}^2(s^*) &= 2(C_1 + \kappa')(C_4 + \frac{cM}{2\sqrt{a^2 + b^2}}) + (C_2 + \frac{aM}{2\sqrt{a^2 + b^2}} + \kappa)^2 \\
&\quad + (C_3 - \frac{bM}{2\sqrt{a^2 + b^2}})^2 - \kappa^2. 
\end{align*}

(3.38)

where

\begin{align*}
s^* &= \frac{1}{\sqrt{a^2 + b^2}} \int \sqrt{c^2 \tau^2 + (c^2 - 2a^2) \kappa^2 - 2ab \tau} \, ds; \quad a, b, c \in \mathbb{R}^+_0. 
\end{align*}

(3.39)

\textbf{Proof.} i) Differentiating the equation (3.34) with respect to \( s \) and considering (2.1), we find

\begin{align*}
\gamma_{\alpha\beta \gamma}'(s^*) \frac{ds^*}{ds} &= \frac{1}{\sqrt{a^2 + b^2}} ((a \kappa + b \tau) x(s) + (-c \kappa) \alpha(s) + (-c \tau) \beta(s) - ay(s)). 
\end{align*}

(3.40)

This can be written as follows

\begin{align*}
\alpha_{\alpha\beta \gamma}(s^*) = \frac{a \kappa + b \tau}{\xi} x(s) + \frac{-c \kappa}{\xi} \alpha(s) + \frac{-c \tau}{\xi} \beta(s) + \frac{-a}{\xi} y(s),
\end{align*}

(3.41)

where

\begin{align*}
\xi &= \sqrt{c^2 \tau^2 + (c^2 - 2a^2) \kappa^2 - 2ab \tau}, \quad \frac{ds^*}{ds} = \frac{Z}{\sqrt{a^2 + b^2}} = W. 
\end{align*}

(3.42)
Differentiating (3.41) and using (3.42), we get
\[
\gamma''_{\alpha\beta y}(s^*) = \frac{\sqrt{a^2 + b^2}}{\xi^3}((\xi'(ak + b\tau) + \xi(ak' + b\tau') - c(\kappa^2 + \tau^2))x(s) + (\xi(2ak + b\tau) - c\kappa\xi')\alpha(s) + (\xi c(\alpha\tau - \tau') - c\tau\xi')\beta(s) + (c\kappa\xi + a)y(s))
\]
\[
y_{\alpha\beta y}(s^*) = -\gamma''_{\alpha\beta y} - \frac{1}{2} \left< \gamma''_{\alpha\beta y}, \gamma''_{\alpha\beta y} \right> \gamma_{\alpha\beta y}. \tag{3.43}
\]
By the help of equation (3.43), we obtain
\[
y_{\alpha\beta y}(s^*) = (-C_1)x(s) - (C_2 + \frac{aM}{2\sqrt{a^2 + b^2}})\alpha(s) \tag{3.44}
\]
\[-(C_3 + \frac{bM}{2\sqrt{a^2 + b^2}})\beta(s) - (C_4 + \frac{cM}{2\sqrt{a^2 + b^2}})y(s),
\]
where \( M = \frac{-2a(ak + b\tau) + c(\kappa^2 + \tau^2)}{\xi^4}. \)

**ii)** Using (3.22), we have (3.36) and (3.37), where

**Example 1.** The curve
\[
x(s) = \frac{1}{\sqrt{2}} (\sin 2s, \cos 2s, 0, 1)
\]
is spacelike in \( \mathbb{Q}^3 \) with arc length parameter \( s \). Then we can write the Smarandache curves of the \( x \)-curve as follows:

1) \( x\alpha\beta \)-Smarandache curve \( \gamma_{x\alpha\beta} \) is given by
\[
\gamma_{x\alpha}(s) = \frac{1}{\sqrt{2}(c^2 + b^2)} ((a - 4c) \sin 2s + 2b \cos 2s, (a - 4c) \cos 2s - 2b \sin 2s, 0, a)
\]

2) \( x\beta y \)-Smarandache curve \( \gamma_{x\beta y} \) is given by
\[
\gamma_{x\beta y}(s) = \frac{1}{\sqrt{2}(2ac + b^2)} ((a - 4c) \sin 2s - 8c \cos 2s, (a - 4c) \cos 2s + 8c \sin 2s, 0, a)
\]

3) \( x\alpha y \)-Smarandache curve \( \gamma_{x\alpha y} \) is given by
\[
\gamma_{x\alpha y}(s) = \frac{1}{\sqrt{2}(2ac + b^2)} (a \sin 2s + (2b - 8c) \cos 2s, a \cos 2s + (-2b + 8c) \sin 2s, 0, a)
\]

4) \( \alpha\beta y \)-Smarandache curve \( \gamma_{\alpha\beta y} \) is given by
\[
\gamma_{\alpha\beta y}(s) = \frac{1}{\sqrt{2}(a^2 + b^2)} ((a - 4b) \sin 2s - 8c \cos 2s, (a - 4b) \cos 2s + 8c \sin 2s, 0, a)
\]

where \( a, b, c \in \mathbb{R}^+ \).
