EFFECT OF ROTATION AND RELAXATION TIMES ON PLANE WAVES IN GENERALIZED THERMO-VISCO-ELASTICITY

S. K. ROYCHoudhuri and SANTWANA MukhopadHYAY

(Received 8 March 1996)

ABSTRACT. The generalized dynamical theory of thermo-elasticity proposed by Green and Lindsay is applied to study the propagation of harmonically time-dependent thermo-visco-elastic plane waves of assigned frequency in an infinite visco-elastic solid of Kelvin-Voigt type, when the entire medium rotates with a uniform angular velocity. A more general dispersion equation is deduced to determine the effects of rotation, visco-elasticity, and relaxation time on the phase-velocity of the coupled waves. The solutions for the phase velocity and attenuation coefficient are obtained for small thermo-elastic couplings by the perturbation technique. Taking an appropriate material, the numerical values of the phase velocity of the waves are computed and the results are shown graphically to illustrate the problem.

Keywords and phrases. Plane waves, rotating visco-elastic medium, generalized thermo-elasticity.

2000 Mathematics Subject Classification. Primary 74Dxx.

1. Introduction. The classical theory of thermoelasticity is based on Fourier's law of heat conduction, which predicts an infinite speed of heat propagation. Many new theories have been proposed to eliminate this physical absurdity. Lord and Shulman [4] first modified Fourier's law by introducing into the field equations the term representing the thermal relaxation time. This modified theory is known as the generalized theory of thermoelasticity. Following Lord-Shulman's theory, several authors including Puri [7] and Nayfeh [6] studied the plane thermoelastic wave propagations. Later, Green and Lindsay [3] developed a more general theory of thermoelasticity, in which Fourier's law of heat conduction is unchanged, whereas the classical energy equation and the stress-strain temperature relations are modified by introducing two constitutive constants $\alpha$ and $\alpha^*$ having the dimensions of time. Using this theory, Agarwal [1, 2] considered, respectively, thermoelastic and magneto-thermoelastic plane wave propagation in an infinite elastic medium. Later, Mukhopadhyay and Bera [5] applied the generalized dynamical theory of thermoelasticity to determine the distributions of temperature, deformation, stress and strain in an infinite isotropic visco-elastic solid of Kelvin-Voigt type permeated by uniform magnetic field having distributed instantaneous and continuous sources.

Recently, attention has been given to the propagation of thermoelastic plane waves in a rotating medium. Following Lord-Shulman's theory, Puri [8], and Roychoudhuri and Debnath [10] studied plane wave propagation in infinite rotating elastic medium. Roychoudhuri [9] applied Green-Lindsay's theory to study the effect of rotation and
relaxation time on plane waves in generalized thermoelasticity. Roychoudhuri and

In the present paper, the linearized theory of green and Lindsay having two re-

laxation times is applied to study the propagation of harmonically time-dependent

thermo-visco-elastic plane waves of assigned frequency in an infinite rotating visco-

elastic solid of Kelvin-Voigt type. Using the perturbation technique, a dispersion rela-

tion for small thermoelastic coupling is obtained to determine the effects of rotation

and relaxation times on the phase velocity of the waves in a visco-elastic medium.

Numerical values of the wave speeds at various frequencies are computed for an ap-

propriate material and are presented graphically for the purpose of illustration.

2. Formulation of the problem. We consider an infinite isotropic homogeneous

visco-elastic solid Kelvin-Voigt type which is rotating uniformly with an angular ve-

locity \( \Omega \). The basic field equations in the temperature-rate dependent theory of Green

and Lindsay follow (in usual notations).

(i) The stress equations of motion in a rotating medium in the absence of body

forces are [12]

\[
\tau_{ij,j} = \rho \left\{ \ddot{u}_i + [\Omega \times (\Omega \times u)]_i + (2\Omega \times \dot{u})_i \right\}, \quad i, j = 1, 2, 3, \tag{2.1}
\]

where

\[
\tau_{ij} = \left( \lambda_e + \lambda_v \frac{\partial}{\partial t} \right) \Delta \delta_{ij} + 2 \left( \mu_e + \mu_v \frac{\partial}{\partial t} \right) e_{ij} - \gamma (\theta + \alpha \dot{\theta}) \delta_{ij}. \tag{2.2}
\]

(ii) The heat conduction equation is

\[
K \theta_{,ii} = \rho c \nu \left( \dot{\theta} + \alpha \ddot{\theta} \right) + \gamma \theta \Delta, \quad i = 1, 2, 3. \tag{2.3}
\]

3. Plane wave solutions and dispersion relation. We consider the waves propa-
gating in the \( x \)-direction and all the field variables are assumed to be functions of \( x \)

and time \( t \) only. We assume that \( u = (u, v, w) \) and \( \Omega = (0, 0, \Omega) \), where \( \Omega \) is a constant. Equation (2.1) with equation (2.2) then reduces to

\[
\rho \left\{ \ddot{u} - u \Omega^2 - 2 \dot{\nu} \Omega \right\} = \left( \lambda_e + 2\mu_e \right) + \left( \lambda_v + 2\mu_v \right) \frac{\partial^2 u}{\partial x^2} - \gamma \left( \frac{\partial \theta}{\partial x} + \alpha \frac{\partial^2 \theta}{\partial x \partial t} \right), \tag{3.1}
\]

\[
\rho \left\{ \dot{v} - v \Omega^2 + 2 \dot{u} \Omega \right\} = \left( \mu_e + \mu_v \frac{\partial}{\partial t} \right) \frac{\partial^2 v}{\partial x^2}, \tag{3.2}
\]

\[
\rho \ddot{w} = \left( \mu_e + \mu_v \frac{\partial}{\partial t} \right) \frac{\partial^2 w}{\partial x^2}. \tag{3.3}
\]

The nondimensional forms of equations (3.1), (3.2), (3.3), and (2.3) are obtained as

\[
\dot{\theta} + \alpha \ddashdot{\theta} - \theta'' + \epsilon_x \ddashdot{u} = 0, \tag{3.4}
\]

\[
[\ddashdot{u} - u \Omega^2 - 2 \ddashdot{\nu}] = \left[ 1 + M \frac{\partial}{\partial t} \right] u'' - (\theta' + \alpha \ddashdot{\theta}), \tag{3.5}
\]

\[
\beta^2 [\ddashdot{v} - v \Omega^2 + 2 \ddashdot{u} \Omega] = \left( 1 + N \frac{\partial}{\partial t} \right) v'', \tag{3.6}
\]

\[
\beta^2 \ddashdot{w} = \left( 1 + N \frac{\partial}{\partial t} \right) w'', \tag{3.7}
\]
where we use the following notation and nondimensional variables:

\[
\begin{align*}
\frac{c_1^2}{\rho} &= \frac{\lambda_e + 2\mu_e}{\rho}, & \kappa &= \frac{K}{\rho c_v}, & \epsilon_\theta &= \frac{\gamma \rho^*}{\rho c_v c_1^2}, \\
\beta^2 &= \frac{\lambda_e + 2\mu_e}{\mu_e}, & M &= \frac{(\lambda_e + 2\mu_e) \cdot c_1^2}{(\lambda_e + 2\mu_e) \cdot \kappa}, \\
N &= \frac{\mu_v}{\kappa}, & \alpha' &= \frac{\alpha c_1^2}{\kappa}, & \alpha^{*'} &= \frac{\alpha^* c_1^2}{\kappa}.
\end{align*}
\]

\(\kappa / c_1^2, \kappa / c_1, \gamma \rho^* \kappa / c_1^3 \rho, \theta^*, c_1^2 / \kappa\) are taken as the units of time, length, displacement, temperature, and rotation, respectively. Primes denote the differentiation with respect to \(x\) and dots denote time differentiation. Equations (3.4), (3.5), and (3.6) form a coupled system and represent coupled visco-thermal-dilatational and shear waves, while equation (3.7) uncouples from the system. This coupling disappears when \(\Omega = 0\). Thus, the thermal field affects the dilatational and shear motion due to rotation.

4. Dispersion equation for the system. For harmonic solutions of the equations (3.4), (3.5), and (3.6), we choose

\[
(u, \nu, \theta) = (u_0, \nu_0, \theta_0) \cdot \exp \{i(qx + \omega t)\},
\]

where \(u_0, \nu_0, \theta_0\) are amplitude constants, \(\omega\) is the prescribed frequency, \(q\) is the wave number, in general complex. The phase velocity \(c\) and the attenuation coefficients \(a\) are then given by

\[
c = \frac{\omega}{\text{Re}(q)}, \quad a = -\text{Im}(q).
\]

Substituting (4.1) into (3.4), (3.5), and (3.6), we obtain

\[
\begin{align*}
(A_1 q^2 - \omega^2 - \Omega^2) u_0 - 2i \omega \Omega \nu_0 - \alpha_1^* \omega q \theta_0 &= 0, \\
2i \omega \Omega \beta^2 u_0 + (A_2 q^2 - \omega^2 \beta^2 - \Omega^2 \beta^2) \nu_0 &= 0, \\
-\epsilon_\theta \omega q u_0 + (q^2 - \omega^2 \alpha_2^*) \theta_0 &= 0,
\end{align*}
\]

where

\[
\begin{align*}
\alpha_1^* &= \alpha' - \frac{i}{\omega}, & \alpha_2^* &= \alpha^{*'} - \frac{i}{\omega}, \\
A_1 &= 1 + i \omega M, & A_2 &= 1 + i \omega N.
\end{align*}
\]

For the nontrivial solutions for \(u_0, \nu_0, \theta_0\), the dispersion equation of the coupled wave is obtained from (4.3) as

\[
(q^2 - \omega^2 \alpha_2^*) \{ (A_1 q^2 - \Omega_0^2) (A_2 q^2 - \Omega_0^2 \beta^2) - 4 \Omega^2 \omega^2 \beta^2 \} - \epsilon_\theta \alpha_1^* \omega^2 q^2 (A_2 q^2 - \Omega_0^2 \beta^2) = 0,
\]

where \(\Omega_0^2 = \Omega^2 + \omega^2\). In case \(\Omega = 0\), the dispersion equation (4.5) reduces to

\[
(A_2 q^2 - \omega^2 \beta^2) \{ (q^2 - \omega^2 \alpha_2^*) (A_1 q^2 - \omega^2) - \epsilon_\theta \alpha_1^* \omega^2 q^2 \} = 0.
\]
On setting $M = 0 = N$, equations (4.5) and (4.6) agree with [9, equations (3.7) and (3.8)], respectively. Equation (4.5) is therefore a more general dispersion equation in the sense that it incorporates the visco-elastic effect as well as the effects of rotation and relaxation parameters on the propagation of coupled waves. This wave may be called the quasi-visco-elastic-thermal-dilatational-shear wave.

5. Perturbation solution for small $\epsilon_\theta$. To obtain the perturbation solution of the dispersion equation for small values of $\epsilon_\theta$, we first put $\epsilon_\theta = 0$ in (4.5) to obtain the following solutions:

$$q^2 = \omega^2 \alpha_2^2, \quad q_{2,1}^2 = J_{2,1}^2,$$

where

$$J_{2,1}^2 = \frac{(A_2 + A_1 \beta^2) \Omega_0^2 \pm \left\{ (A_2 + A_1 \beta^2)^2 \Omega_0^4 - 4A_1 A_2 \beta^2 (\Omega^2 - \omega^2)^2 \right\}^{1/2}}{2A_1 A_2}. (5.2)$$

Next, let us write $q^2$ in the following forms:

$$q_u^2 = q_{2,1}^2 + n_u \epsilon_\theta + 0(\epsilon_\theta^2),$$
$$q_v^2 = q_{2,2}^2 + n_v \epsilon_\theta + 0(\epsilon_\theta^2),$$
$$q_\theta^2 = \omega^2 \alpha_2^2 + n_\theta \epsilon_\theta + 0(\epsilon_\theta^2). (5.3)$$

Substituting into equation (4.5), comparing the lowest power of $\epsilon_\theta$, and neglecting the terms of $0(\epsilon_\theta^2)$, we obtain

$$q_u^2 = J_{1,1}^2 \left[ 1 + \frac{\omega^2 \alpha_1^2 \epsilon_\theta (A_2 J_{1,1}^2 - \beta^2 \Omega_0^2)}{D_1} \right],$$
$$q_v^2 = J_{2,2}^2 \left[ 1 + \frac{\omega^2 \alpha_1^2 \epsilon_\theta (A_2 J_{2,2}^2 - \beta^2 \Omega_0^2)}{D_2} \right],$$
$$q_\theta^2 = \omega^2 \alpha_2^2 \left[ 1 + \frac{\alpha_\epsilon^\theta \omega^2 \epsilon_\theta (A_2 \alpha_\epsilon^\theta \omega^2 - \beta^2 \Omega_0^2)}{(A_1 \alpha_\epsilon^\theta \omega_2 - \Omega_0^2)(A_2 \alpha_\epsilon^\theta \omega^2 - \beta^2 \Omega_0^2) - 4\Omega^2 \beta^2 \omega^2} \right]. (5.6)$$

where

$$D_{1,2} = (J_{1,2}^2 - \omega^2 \alpha_2^2) \left\{ 2A_1 A_2 J_{1,2}^2 - A_1 \beta^2 \Omega_0^2 - A_2 \Omega_0^2 \right\}$$
$$+ (A_1 J_{1,2}^2 - \Omega_0^2)(A_2 J_{1,2}^2 - \beta^2 \Omega_0^2) - 4\Omega^2 \beta^2 \omega^2. (5.7)$$

On putting $M = 0 = N$, the results (5.2), (5.4), and (5.5) are in agreement with the corresponding results of [9].

6. Determination of wave speeds and attenuation coefficients. From the above solutions, we can observe that the dilatational, shear, and thermal waves propagate in the visco-elastic medium, and these waves are affected by the thermo-visco-elastic coupling coefficient $\epsilon_\theta$. Now we find out the wave speed and the attenuation coefficients of the waves for small $\epsilon_\theta$. 

I. QUASI-VISCO-TERMAL WAVE. Separating real and imaginary parts, we get from (5.6), for small $\epsilon_\theta$,

\[
\text{Re}(q_\theta) = \omega \sqrt{\frac{L + \alpha^*}{2}} + \frac{1}{2} \epsilon_\theta \cdot \frac{\omega^3}{\sqrt{2}} \cdot \frac{1}{(D_f^2 + D_m^2)} \times \left[ \sqrt{L + \alpha^*} (N_Y D_Y + N_m D_m) - \sqrt{L - \alpha^*} (N_m D_Y - N_Y D_m) \right],
\]

\[
\text{Im}(q_\theta) = \omega \sqrt{\frac{L - \alpha^*}{2}} + \frac{1}{2} \epsilon_\theta \cdot \frac{\omega^3}{\sqrt{2}} \cdot \frac{1}{(D_f^2 + D_m^2)} \times \left[ \sqrt{L + \alpha^*} (N_m D_Y - N_Y D_m) - \sqrt{L - \alpha^*} (N_Y D_Y + N_m D_m) \right],
\]

where

\[N_Y = \alpha' (\alpha^* \omega^2 + N \omega^2 - \Omega_0^2 \beta^2) - (1 - \alpha^* N \omega^2),\]

\[N_m = -\left( \alpha^* \omega + N \omega - \frac{\Omega_0^2 \beta^2}{\omega} \right) - \alpha' \omega (1 - \alpha^* N \omega^2),\]

\[D_Y = \alpha^* (\omega^2 + N \omega^2 - \Omega_0^2 \beta^2) (\alpha^* \omega^2 + N \omega^2 - \Omega_0^2 \beta^2) - \omega^2 (1 - \alpha^* M \omega^2) (1 - \alpha^* N \omega^2) - 4 \omega^2 \Omega_0^2 \beta^2,\]

\[D_m = -\omega \left[ (1 - \alpha^* M \omega^2) (\alpha^* \omega^2 + N \omega^2 - \Omega_0^2 \beta^2) + (1 - \alpha^* N \omega^2) (\alpha^* \omega^2 + M \omega^2 - \Omega_0^2 \beta^2) \right],\]

\[L = \sqrt{\frac{\{ (\alpha^* \omega)^2 + 1 \}}{\omega}},\]

\[\sqrt{\alpha_2^*} = \frac{1}{\sqrt{2}} \left[ \sqrt{L + \alpha^*} + i \sqrt{L - \alpha^*} \right].\]

Therefore, the thermal wave speed $c_\theta = \omega \text{Re}(q_\theta)$ and the attenuation coefficient $a_\theta = -\text{Im}(q_\theta)$, where Re($q_\theta$) and Im($q_\theta$) are obtained above.

II. QUASI-VISCO-DILATATIONAL WAVE. Using (5.2) from (5.4) for small $\epsilon_\theta$, the quasi-visco-elastic dilatational wave speed $c_e = \omega \text{Re}(q_u)$ and the attenuation coefficient $a_e = -\text{Im}(q_u)$, where

\[
\text{Re}(q_u) = A_3 + \frac{1}{2} \epsilon_\theta \omega \cdot \frac{1}{(P^2 + Q^2)} \left[ A_3 \left( P (\alpha' \omega K_3 + K_4) + Q (\alpha' \omega K_4 - K_3) \right) \right. \]
\[\left. - B_3 \left( P (\alpha' \omega K_4 - K_3) - Q (\alpha' \omega K_3 + K_4) \right) \right],
\]

\[
\text{Im}(q_u) = B_3 + \frac{1}{2} \epsilon_\theta \omega \cdot \frac{1}{(P^2 + Q^2)} \left[ B_3 \left( P (\alpha' \omega K_3 + K_4) + Q (\alpha' \omega K_4 - K_3) \right) \right. \]
\[\left. + A_3 \left( P (\alpha' \omega K_4 - K_3) - Q (\alpha' \omega K_3 + K_4) \right) \right].
\]
where

\[
A_3 = \frac{1}{2} \left[ R_3 + \sqrt{R_3^2 + R_4^2} \right]^{1/2}, \quad B_3 = \frac{1}{2} \frac{R_4}{|R_4|} \left[ -R_3 + \sqrt{R_3^2 + R_4^2} \right]^{1/2},
\]

\[
R_3 = \frac{\left( 1 - \omega^2 MN \right) \left[ (\beta^2 + 1) \Omega_0^2 - A \right] + (M + N) \omega \times \left[ \Omega_0^2 \omega (N + M \beta^2) - B \right]}{\left( 1 - \omega^2 MN \right)^2 + \omega^2 (M + N)^2},
\]

\[
R_4 = \frac{\left( 1 - \omega^2 MN \right) \left[ \Omega_0^2 \omega (N + M \beta^2) - B \right] - (M + N) \omega \times \left[ (\beta^2 + 1) \Omega_0^2 - A \right]}{\left( 1 - \omega^2 MN \right)^2 + \omega^2 (M + N)^2},
\]

\[
A = \frac{1}{\sqrt{2}} \left[ P_1 + \sqrt{P_1^2 + P_2^2} \right]^{1/2}, \quad B = \frac{P_2}{|P_2|} \cdot \frac{1}{\sqrt{2}} \left[ -P_1 + \sqrt{P_1^2 + P_2^2} \right]^{1/2},
\]

\[
P_1 = \left\{ (\beta^2 + 1)^2 - \omega^2 (N + M \beta^2) \right\} \Omega_0^2 - 4 \beta^2 (1 - \omega^2 MN) (\Omega^2 - \omega^2),
\]

\[
P_2 = \omega \left[ 2 (\beta^2 + 1) (N + M \beta^2) \Omega_0^2 - 4 \beta^2 (M + N) (\Omega^2 - \omega^2) \right],
\]

\[
K_3 = R_3 - \beta^2 \Omega_0^2 - R_4 \omega M, \quad K_4 = R_4 + R_3 \omega M,
\]

\[
E_3 = 2R_3 \left( 1 - \omega^2 MN \right) - 2R_4 \omega (M + N) - (\beta^2 + 1) \Omega_0^2,
\]

\[
E_4 = 2R_4 \left( 1 - \omega^2 MN \right) + 2R_3 \omega (M + N) - \omega (N + M \beta^2) \Omega_0^2,
\]

\[
F_3 = R_3 - R_4 \omega N - 2 \Omega_0^2, \quad F_4 = R_4 + R_3 \omega N,
\]

\[
P = E_3 (R_3 - \alpha^* \omega^2) - E_4 (R_4 + \omega) + F_3 K_3 - F_4 K_4 - 4 \Omega^2 \omega^2 \beta^2,
\]

\[
Q = E_3 (R_4 + \omega) + E_4 (R_3 - \alpha^* \omega^2) + F_4 K_3 + F_3 K_4.
\]

III. Quasi-Visco-Shear Wave. Using (5.2), we get from (5.5) for small \( \epsilon \omega \), the quasi-visco-shear wave speed \( c_5 = \omega / \text{Re}(q_{\nu}) \) and the attenuation coefficient \( a_5 = -\text{Im}(q_{\nu}) \), where

\[
\text{Re}(q_{\nu}) = A_1 + \frac{1}{2} \epsilon \omega \alpha \cdot \frac{1}{P^2 + Q^2} \left[ A_1 \left[ P' (\alpha' \omega K_1 + K_2) \right.ight.
\]

\[
+ Q' (\alpha' \omega K_2 - K_1) \right] - B_1 \left[ P' (\alpha' \omega K_2 - K_1) - Q' (\alpha' \omega K_1 + K_2) \right],
\]

\[
\text{Im}(q_{\nu}) = B_1 + \frac{1}{2} \epsilon \omega \alpha \cdot \frac{1}{P^2 + Q^2} \left[ B_1 \left[ P' (\alpha' \omega K_1 + K_2) \right.ight.
\]

\[
+ Q' (\alpha' \omega K_2 - K_1) \right] + A_1 \left[ P' (\alpha' \omega K_2 - K_1) - Q' (\alpha' \omega K_1 + K_2) \right],
\]

\[
A_1 = \frac{1}{2} \left[ R_1 + \sqrt{R_1^2 + R_2^2} \right]^{1/2}, \quad B_1 = \frac{R_2}{|R_2|} \cdot \frac{1}{2} \left[ -R_1 + \sqrt{R_1^2 + R_2^2} \right]^{1/2},
\]

\[
P' = E_1 (R_1 - \alpha^* \omega^2) - E_2 (R_2 + \omega) + F_1 K_1 - F_2 K_2 - 4 \Omega^2 \omega^2 \beta^2,
\]

\[
Q' = E_1 (R_2 + \omega) + E_2 (R_1 - \alpha^* \omega^2) + F_2 K_1 + F_1 K_2,
\]

where \( R_1 \) and \( R_2 \) have the same expressions as \( R_3 \) and \( R_4 \), respectively, with \(-A, -B\) in place of \( A, B \), respectively, and \( E_1, E_2, K_1, K_2, F_1, F_2 \) have the same expressions as \( E_3, E_4, K_3, K_4, F_3, F_4 \), respectively, with \( R_1 \) and \( R_2 \) in place of \( R_3 \) and \( R_4 \), respectively.
7. Numerical results and discussions. For numerical work, we take copper as the working substance for which

\[
\lambda_e = 1.387 \times 10^{12} \text{ dyne} / \text{cm}^2, \quad \mu_e = 0.448 \times 10^{12} \text{ dyne} / \text{cm}^2, \\
\rho = 8.93 \text{ g/cm}^3, \quad \kappa = 1.14 \text{ cm}^2 / \text{s}, \quad \alpha = 1.67 \times 10^{-8} / ^\circ \text{C}, \\
\alpha = 10^{-11} \text{ s}, \quad \alpha^a = 2 \times 10^{-11} \text{ s}. \quad (7.1)
\]

We take \( \Omega = 0.1 \).

The numerical computations of the quasi-visco-dilatational wave speed, the quasi-visco-shear wave speed, and the quasi-visco-thermal wave speed for small values of \( \epsilon \theta \) are done with the help of a PC and the corresponding graphs are plotted.

The quasi-visco-dilatational wave speed is drawn against the real frequency \( \omega \) for three different values of the visco-elastic parameter \( M \) in Figure 7.1. The quasi-visco-shear wave speed is plotted against \( \omega \) for three different values of \( M \) in Figure 7.2 and the quasi-visco-thermal wave speed is drawn against \( \omega \) for the same values of \( M \) in Figure 7.3.

The variation of different wave speeds with the visco-elastic parameter \( M \) can be seen from the graphs. It is observed that although in case of quasi-visco-thermal wave speed (Figure 7.3) the variation is not pronounced appreciably, in cases of the quasi-visco-dilatational wave speed (Figure 7.1) and the quasi-visco-thermal-shear wave speed (Figure 7.2) the variations are more pronounced for higher values of \( \omega \).

Special Issue on
Time-Dependent Billiards

Call for Papers

This subject has been extensively studied in the past years for one-, two-, and three-dimensional space. Additionally, such dynamical systems can exhibit a very important and still unexplained phenomenon, called as the Fermi acceleration phenomenon. Basically, the phenomenon of Fermi acceleration (FA) is a process in which a classical particle can acquire unbounded energy from collisions with a heavy moving wall. This phenomenon was originally proposed by Enrico Fermi in 1949 as a possible explanation of the origin of the large energies of the cosmic particles. His original model was then modified and considered under different approaches and using many versions. Moreover, applications of FA have been of a large broad interest in many different fields of science including plasma physics, astrophysics, atomic physics, optics, and time-dependent billiard problems and they are useful for controlling chaos in Engineering and dynamical systems exhibiting chaos (both conservative and dissipative chaos).

We intend to publish in this special issue papers reporting research on time-dependent billiards. The topic includes both conservative and dissipative dynamics. Papers discussing dynamical properties, statistical and mathematical results, stability investigation of the phase space structure, the phenomenon of Fermi acceleration, conditions for having suppression of Fermi acceleration, and computational and numerical methods for exploring these structures and applications are welcome.

To be acceptable for publication in the special issue of Mathematical Problems in Engineering, papers must make significant, original, and correct contributions to one or more of the topics above mentioned. Mathematical papers regarding the topics above are also welcome.

Authors should follow the Mathematical Problems in Engineering manuscript format described at http://www.hindawi.com/journals/mpe/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
