A NOTE ON THE COUNTABLE UNION OF PRIME SUBMODULES

M. R. POURNAKI and M. TOUSI

(Received 11 November 2000)

ABSTRACT. Let $M$ be a finitely-generated module over a Noetherian ring $R$. Suppose $a$ is an ideal of $R$ and let $N = aM$ and $b = \text{Ann}(M/N)$. If $b \subseteq J(R)$, $M$ is complete with respect to the $b$-adic topology, $\{P_i\}_{i \geq 1}$ is a countable family of prime submodules of $M$, and $x \in M$, then $x + N \subseteq \bigcup_{i \geq 1} P_i$ implies that $x + N \subseteq P_j$ for some $j \geq 1$. This extends a theorem of Sharp and Vámos concerning prime ideals to prime submodules.

2000 Mathematics Subject Classification. 13C99, 13J10, 13E05.

1. Introduction. Let $R$ be a commutative ring with identity. One of the fundamental cornerstones of commutative ring theory is the “prime avoidance” theorem, which states that, if $p_1, \ldots, p_n$ are prime ideals of $R$ and $a$ is an ideal of $R$ such that $a \subseteq \bigcup_{i \geq 1} p_i$, then $a \subseteq p_j$ for some $1 \leq j \leq n$. In [4], the authors proved and used an extension of the following.

**Theorem 1.1.** Let $R$ be a Noetherian local ring having maximal ideal $m$. Let $\{p_i\}_{i \geq 1}$ be a countable family of prime ideals of $R$, $a$ an ideal of $R$, and $x \in R$. If $R$ is complete with respect to the $m$-adic topology, then $x + a \subseteq \bigcup_{i \geq 1} p_i$ implies that $x + a \subseteq p_j$ for some $j \geq 1$.

Consider $M$ as a unitary left $R$-module. A submodule $P$ of $M$ is called prime submodule, if $P \neq M$ and for each $r \in R$ and $m \in M$, $rm \in P$ implies that $r \in \text{Ann}(M/P)$ or $m \in P$. Of course, if we regard $R$ as an $R$-module, then the concept of prime submodules is equivalent to the concept of prime ideals. Now it is natural to ask if the “prime avoidance” theorem is true for prime submodules. In fact the answer is affirmative as has been shown by Lu [2].

**Theorem 1.2.** Let $M$ be an $R$-module and $P_1, \ldots, P_n$ be prime submodules of $M$. Let $N$ be a submodule of $M$ such that $N \subseteq \bigcup_{i=1}^n P_i$. Also assume that $\text{Ann}(M/P_j) \neq \text{Ann}(M/P_k)$ for $j \neq k$. Then $N \subseteq P_j$ for some $1 \leq j \leq n$.

The main purpose of this paper is to generalize the above theorem to a countable family of prime submodules.

2. Main result. Let $R$ be a Noetherian ring, $a$ an ideal of $R$ contained in the Jacobson radical of $R$, and $M$ a finitely-generated $R$-module. The $a$-adic topology is metrizable and one suitable metric $d$ may be given by requiring that, for $x, y \in M$ with $x$ and $y$ different, $d(x, y) = 1/2^t$, where $t$ is the greatest integer $i$ such that $x - y \in a^iM$. 

Now, we apply the Baire’s category theorem for deducing our main result. Note that the Baire’s category theorem states that a complete metric space is not the union of a countable family of nowhere dense subsets, and a subset of a metric space \( M \) is nowhere dense in \( M \) if and only if its closure has no interior point (see [1, page 38]). In the sequel, we denote the Jacobson radical of \( R \) by \( J(R) \).

**Main Theorem 2.1.** Let \( M \) be a finitely-generated module over a Noetherian ring \( R \). Suppose \( \mathfrak{a} \) is an ideal of \( R \) and let \( N = \mathfrak{a}M \) and \( \mathfrak{b} = \text{Ann}(M/N) \). If \( \mathfrak{b} \subseteq J(R), M \) is complete with respect to the \( \mathfrak{b} \)-adic topology, \( \{P_j\}_{j \geq 1} \) is a countable family of prime submodules of \( M \), and \( x \in M \), then \( x + N \subseteq \bigcup_{i \geq 1} P_i \) implies that \( x + N \subseteq P_j \) for some \( j \geq 1 \).

We will need the following well-known result which is essentially due to Krull.

**Lemma 2.2.** If \( M \) is a finitely-generated module over a Noetherian ring \( R \) and \( \mathfrak{b} \) an ideal of \( R \) such that \( \mathfrak{b} \subseteq J(R) \), then each submodule of \( M \) with respect to the \( \mathfrak{b} \)-adic topology is closed (see [3, Theorem 8.10]).

**Proof of the main theorem.** By Lemma 2.2, each submodule of \( M \) and in particular \( N \) is closed with respect to the \( \mathfrak{b} \)-adic topology. One easily obtains that \( x + N \) is also a closed subset of \( M \). So the completeness of \( M \) yields that \( x + N \) is a complete metric space. But by hypothesis we have \( x + N = \bigcup_{i \geq 1} ((x + N) \cap P_i) \) and therefore it turns out by Baire’s category theorem that, there is some \( j \geq 1 \) for which the subset \( (x + N) \cap P_j \) of \( x + N \) is not nowhere dense. But \( (x + N) \cap P_j \) is closed in \( x + N \) and therefore the interior of \( (x + N) \cap P_j \) in \( x + N \) is not empty. Let \( c \) be an element of the interior of \( (x + N) \cap P_j \). Thus there exists an open subset \( U \) of \( M \) such that \( c \in (x + N) \cap U \subseteq (x + N) \cap P_j \). But \( c \in U \) implies that, there is \( k \in \mathbb{N} \) such that \( c + \mathfrak{b}^k M \subseteq U \). Since \( P_j \) is a prime submodule of \( M \), it follows that \( \text{Ann}(M/P_j) \) is a prime ideal of \( R \) and so \( \mathfrak{b} \subseteq \text{Ann}(M/P_j) \).

**Remark 2.3.** (i) Note that if \( M \) is a finitely-generated module over a Noetherian ring \( R \), \( \mathfrak{a}_1 \subseteq \mathfrak{a}_2 \) ideals of \( R \), and \( M \) complete with respect to the \( \mathfrak{a}_2 \)-adic topology, then it is also complete with respect to the \( \mathfrak{a}_1 \)-adic topology. This shows that, the main theorem is also true if we assume that \( M \) is complete in \( J(R) \)-adic topology.

(ii) In the view of (i), it is clear that Theorem 1.1 is a particular case of the main theorem.

Special Issue on
Singular Boundary Value Problems for Ordinary Differential Equations

Call for Papers

The purpose of this special issue is to study singular boundary value problems arising in differential equations and dynamical systems. Survey articles dealing with interactions between different fields, applications, and approaches of boundary value problems and singular problems are welcome.

This Special Issue will focus on any type of singularities that appear in the study of boundary value problems. It includes:

- Theory and methods
- Mathematical Models
- Engineering applications
- Biological applications
- Medical Applications
- Finance applications
- Numerical and simulation applications

Before submission authors should carefully read over the journal’s Author Guidelines, which are located at http://www.hindawi.com/journals/bvp/guidelines.html. Authors should follow the Boundary Value Problems manuscript format described at the journal site http://www.hindawi.com/journals/bvp/. Articles published in this Special Issue shall be subject to a reduced Article Processing Charge of €200 per article. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:

<table>
